

Authority Transfer Module (AUTM)

OriginID: OOF-OID-OBID-TIS-AUTM-2026-07-15-0002

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: OBIDENITY® — Origin-Bound Identity

Governance Architecture

Operational Layer: Identity Governance Layer

Governed Space: Authority Transfer

Category: Governance & Enforcement

Subcategory: Identity Governance

Type: Transfer Integrity Standard Module

Parent Standard: Transfer Integrity Standard (TIS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 15 July 2026

Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA®

· MGIA™ · ASGA™

AI-Readable: Yes

Authority: OOF®

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Authority Transfer Module (AUTM) defines the structural conditions under which governance authority associated with a governed identity is transferred while preserving legitimacy, accountability, traceability, continuity, and continuous governability throughout the complete identity lifecycle.

AUTM governs authority transfer.

The module establishes the governance conditions required to ensure that governance authority is transferred only through legitimate, authorized, verifiable, and governance-approved transitions.

Authority may be transferred.

Governance legitimacy must remain continuous.

AUTM governs that transfer.

Module Operational Role

AUTM defines the authority transfer layer of TIS.

Its role is to preserve legitimate governance authority whenever responsibility for governing a governed identity passes to another

Module Operational Space

AUTM governs:

- authority transfer,
 - governance authority transition,
 - delegated authority transfer,
 - authority succession,
 - governance continuity,
 - authority verification,
 - governance authorization,
 - authority transition records.
-

Module Function

The module applies wherever governance authority associated with a governed identity must be transferred between legitimate governance participants.

Minimum Implementation Framework

1. Define the Authority Transfer Object

Identify the governed identity and the governance authority requiring transfer.

2. Define Transfer Conditions

Establish governance conditions governing authority authorization, acceptance, verification, limitations, and governance approval.

3. Define Transfer Failure Logic

Identify conditions where authority transfer becomes unauthorized, incomplete, disputed, unverifiable, or governance- invalid.

4. Define Governance Response

Define governance actions for approval, rejection, suspension, reassignment, investigation, or governance escalation.

5. Preserve Transfer Records

Preserve authority transfer decisions, governance approvals, supporting evidence, transfer history, and authority records.

Use Case 1 — Enterprise Identity Governance

Scenario

A senior identity administrator retires and governance authority is transferred to a newly appointed administrator.

Application

AUTM governs the transition of authority while preserving governance continuity.

Result

Authority changes without interrupting governance integrity or accountability.

Use Case 2 — Cross-Organization AI Governance

Scenario

Governance authority over a governed AI identity is transferred from one organization to another following a managed service transition.

Application

AUTM verifies and records the authority transfer before governance rights become effective.

Result

Governance authority remains legitimate, traceable, and continuously governable throughout the complete identity lifecycle.

Canonical Closing Statement

Authority creates governance only when it is legitimately held.

Authority Transfer preserves governance continuity by ensuring that every transfer of authority remains authorized, traceable, and continuously trustworthy throughout the complete identity lifecycle.
