

Transfer Validation Module (TVAM)

OriginID: OOF-OID-OBID-TIS-TVAM-2026-07-15-0005
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: OBIDENTITY® — Origin-Bound Identity
Governance Architecture
Operational Layer: Identity Governance Layer
Governed Space: Transfer Validation
Category: Governance & Enforcement
Subcategory: Identity Governance
Type: Transfer Integrity Standard Module
Parent Standard: Transfer Integrity Standard (TIS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 15 July 2026
Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA®
· MGIA™ · ASGA™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Transfer Validation Module (TVAM) defines the structural conditions under which the transfer of a governed identity and its associated governance relationships is verified, validated, approved, and continuously governable throughout the complete identity lifecycle.

TVAM governs transfer validation.

The module establishes the governance conditions required to ensure that every completed transfer satisfies predefined governance, ownership, authority, provenance, continuity, and accountability requirements before becoming operationally valid.

Transfer moves identity.

Validation confirms governance integrity.

TVAM governs that validation.

Module Operational Role

TVAM defines the transfer validation layer of TIS.

Its role is to verify that every identity transfer preserves the complete governance integrity of the governed identity before the

transfer becomes effective.

Module Operational Space

TVAM governs:

- transfer validation,
 - governance validation,
 - transfer verification,
 - ownership verification,
 - authority verification,
 - transfer approval,
 - governance compliance,
 - identity transfer assurance.
-

Module Function

The module applies wherever organizations must validate that a governed identity transfer satisfies all governance requirements before completion.

Minimum Implementation Framework

1. Define the Transfer Validation Object

Identify the governed identity and the transfer requiring validation.

2. Define Validation Conditions

Establish governance conditions governing legitimacy, continuity, provenance, ownership, authority, accountability, and governance approval.

3. Define Validation Failure Logic

Identify conditions where the transfer becomes incomplete, unverifiable, inconsistent, unauthorized, disputed, or governance-invalid.

4. Define Governance Response Define governance actions for approval, rejection, correction, suspension, investigation, revalidation, or governance escalation.

5. Preserve Validation Records

Preserve validation results, governance approvals, supporting evidence, transfer history, verification documentation, and audit records.

Use Case 1 — Enterprise Identity Migration

Scenario

An organization completes the transfer of a strategic governed identity to a new legal entity.

Application

TVAM validates that ownership, authority, permissions, provenance, and governance continuity have all been successfully preserved.

Result

The transfer becomes governance-valid and operationally trusted.

Use Case 2 — Cross-Platform AI Identity Transfer

Scenario

A governed AI identity is migrated to a new AI infrastructure spanning multiple jurisdictions.

Application

TVAM validates that the transferred identity retains its complete governance relationships before activation.

Result

The transferred identity remains legitimate, trustworthy, and continuously governable throughout the complete identity lifecycle.

Canonical Closing Statement

A transfer is complete only when governance confirms it. Transfer Validation preserves identity trust by ensuring that every governed transfer is independently verified before it becomes part of the identity's continuing lifecycle.
