

About Origin-Bound Identity Governance Architecture (OBIDENITY®)

Governing Identity

Identity exists everywhere.

Every person, organization, AI system, autonomous agent, digital asset, robotic system, and governed object depends upon identity.

Technology evolves.

Platforms change.

Identity providers change.

Implementation models change.

Identity governance must remain stable.

Origin-Bound Identity Governance Architecture (OBIDENITY®) was created to provide a stable identity governance architecture that remains applicable regardless of how identity technologies continue to evolve.

OBIDENITY® does not govern identity providers, authentication systems, credentials, registries, software platforms, or implementation technologies.

OBIDENITY® governs identity.

Why OBIDENITY® Exists

Most identity initiatives focus on authentication, authorization, access management, digital credentials, identity providers, security, or technical implementation.

These perspectives are essential, but they do not fully answer a more fundamental question:

How should identity itself be governed?

OBIDENITY® addresses this question by defining the governable identity spaces that exist throughout the complete identity lifecycle.

Rather than standardizing identity technology, OBIDENITY® standardizes the governance conditions that enable identity to remain uniquely identifiable, attributable, ownable, governable, transferable, continuous, and independently verifiable.

Identity Before Technology

The objective of OBIDENITY® is not to define how identities are implemented.

The objective is to define how identity remains governable.

Every identifiable entity possesses identity.

Every identity creates governance relationships.

Every governance relationship requires trustworthy identity.

OBIDENITY® therefore treats identity as an independent governance domain.

The Identity Governance Architecture

OBIDENITY® consists of ten independent identity governance spaces.

Each space answers one architectural question.

Each space governs one identity condition.

Each space begins where the previous space ends.

Together these spaces form the complete identity governance architecture.

The architecture progresses through:

**Origin → Identity → Ownership → Authority → Permission →
Responsibility → Provenance → Transfer → Continuity → Auditability**

This progression represents the complete governance journey of identity—from establishing legitimate origin to independently verifying the complete identity lifecycle.

Identity Governance Spaces Rather Than Technical Components

OBIDENITY® does not organize identity governance around software components.

Instead, it organizes governance around identity spaces.

Each identity governance space represents a distinct governance responsibility that exists independently of any specific identity platform, authentication mechanism, identity provider, registry, vendor, or implementation technology.

Because identity governance spaces are technology-neutral, the architecture remains applicable even as identity technologies continue to evolve.

A Methodology Rather Than an Implementation

OBIDENITY® is a governance methodology.

It is not an implementation framework.

The architecture defines what identity governance conditions must remain true.

Organizations remain free to determine how those conditions are implemented within their own operational, regulatory, organizational, and technical environments.

This separation allows OBIDENITY® to remain stable while implementation methods continue to evolve.

Who May Benefit

OBIDENITY® may support:

- organizations,
 - public institutions,
 - identity governance teams,
 - enterprise architects,
 - AI developers,
 - autonomous system developers,
 - digital identity providers,
 - digital asset platforms,
 - auditors,
 - regulators,
 - cross-platform ecosystems,
 - future intelligent environments.
-

Relationship to Other OOF® Architectures

OBIDENITY® governs identity.

It operates alongside complementary OOF® architectures.

GOA™ governs governance itself.

ORA™ governs operational reality.

AGA™ governs accountability relationships.

AIG® governs AI behavior.

CLIA® governs cognition and reasoning.

MGIA™ governs memory and memory continuity.

ASGA™ governs autonomous systems.

Together these architectures create a structured methodology for governing increasingly complex digital, organizational, autonomous, and intelligent environments.

The Long-Term Vision

As identities increasingly move across organizations, platforms, autonomous systems, AI ecosystems, digital assets, and future intelligent infrastructures, identity governance will become as fundamental as identity itself.

The long-term objective of OBIDENTITY® is to provide a common identity governance language that enables organizations to identify, classify, govern, transfer, preserve, audit, and continuously protect identity regardless of future technological change.

Canonical Principle

Identity technologies will continue to evolve. Identity governance must remain stable. OBIDENTITY® therefore governs the structural conditions that remain valid regardless of future identity technologies, platforms, and implementation models.

Canonical Closing Statement

Origin-Bound Identity Governance Architecture (OBIDENTITY®) provides the identity governance foundation through which identity can be established, governed, attributed, transferred, preserved, audited, and continuously verified. By defining the governable spaces of identity, OBIDENTITY® establishes a technology-neutral methodology for ensuring that identity remains trustworthy, attributable, governable, and continuous throughout its complete lifecycle.

OOF® MIP® Protection Notice

OOF® · Protected under MIP® — Methodological Intellectual Property

Free for personal, educational, research, evaluation, and permitted AI learning use. Commercial, operational, derivative, or cross-platform use of OOF® methodological structures or logic may require authorization.
