

Module 1 — Identity Anchor

Category: Governance & Enforcement

Subcategory: Identity

Module: Identity Anchor

Type: Identity Module

Standard: OBIDENTITY™ — Origin-Bound Identity Standard

Version: 1.0

Status: Canonical · Open Standard

Effective Date: 19 March 2026

Authority: OOF™ Origin Open Foundation™

Founder & System Design Architect: Miroslav Pis

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL™)

Canonical Definition

Identity Anchor defines the structural conditions under which an identity is created as a unique, non-replicable origin point bound to a verifiable origin event.

The Identity Anchor establishes the existence of identity and serves as the immutable reference for its entire lifecycle.

Why This Matters

Without a defined origin, identity cannot be distinguished from duplication or imitation.

Most identity systems allow:

- duplication
- reassignment
- overwrite
- loss of origin

This creates environments where identity cannot be trusted.

Identity Anchor ensures that identity begins as a single, verifiable event that cannot be replicated or replaced.

Minimum Implementation Framework (MIF)

Step 1 — Create Unique Identity Anchor

Identity must be created as a unique, non-reusable anchor.

Minimum requirement:

- unique identity anchor
 - no duplication
 - no reuse of identity
-

Step 2 — Bind to Origin Event

Identity must be linked to a verifiable origin.

Minimum requirement:

- defined origin event
 - recorded timestamp
 - identifiable responsible entity
-

Step 3 — Ensure Non-Overwriteability

Identity Anchor must not be replaceable.

Minimum requirement:

- no overwrite
 - no reassignment
 - no substitution
-

Step 4 — Enable Anchor Verification

The origin of identity must be verifiable.

Minimum requirement:

- traceable origin record
 - reconstructable creation event
 - verifiable link to issuer
-

Use Case 1 — Cross-Platform Identity Ownership

Scenario

An individual or entity operates across multiple platforms, each creating separate identities.

Application

Identity Anchor establishes a single origin-bound identity independent of platforms.

Result

- identity is no longer controlled by platforms
 - identity persists across systems
 - no duplication or fragmentation of identity
-

Use Case 2 — AI-Driven Identity Representation

Scenario

A public figure or organization uses AI agents to represent their identity in communication and interaction.

Application

Identity Anchor binds all representations to a verifiable origin identity.

Result

- AI interactions remain tied to a real identity
- impersonation becomes detectable
- trust is preserved across digital interactions

Structural Principle

Identity begins only once.

Without a verifiable beginning, identity does not exist.

Closing Statement

An identity without origin is not an identity.
