

RBM — Relationship Boundary Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

Parent Standard: Operational Boundary Synchronization Standard

Category: Governance & Enforcement

Subcategory: Human Operational Interdependence & Shared Survival Structures

Type: Operational Boundary Synchronization Module

Version: 1.0

Status: Canonical · Open Module

Effective Date: 14 May 2026

Compatibility: OOF Methodology OS · OBS · INTEGROS · MTVF · EVIP · ORGS

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Relationship Boundary Module (RBM) defines the structural conditions under which human operational relationships become synchronized through shared survival conditions, economic dependency, operational continuity, resource interdependence, or coordinated consequence propagation while preserving reviewable operational boundary visibility.

RBM establishes the human interdependence layer of OBS.

The module governs how human operational systems:

- remain independent
- become synchronized
- absorb dependency conditions
- preserve shared operational continuity
- or fragment into separated operational structures
- across long-term interdependent environments.
- RBM does not govern emotion, affection, ideology, or personal preference.
- RBM governs operational interdependence.

Module Function

RBM defines the synchronization-governance architecture of human operational relationships.

It ensures that operational interdependence between individuals or shared human systems remains structurally interpretable beyond symbolic legal or social labels alone.

The module applies wherever human systems share:

- economic dependency
- operational continuity
- survival consequence
- infrastructure reliance
- caregiving structures
- coordinated resource management
- shared operational environments
- synchronized external pressure
- long-term survival conditions

Its function is not to regulate private relationships.

Its function is to interpret when operational synchronization becomes structurally real.

Minimum Implementation Framework

Step 1 — Define the Human Operational Boundary Object

The organization or governance environment must define what human operational structure is being examined for synchronization conditions.

Minimum requirement:

- the operational boundary object is explicit
- the relationship scope is structurally bounded
- undefined human operational structures are excluded from valid synchronization interpretation

The boundary object may include:

- marriages
- partnerships
- family systems
- caregiving environments
- shared economic households
- cohabitation structures
- long-term dependency systems
- synchronized survival environments

Step 2 — Define Relationship Synchronization Conditions

The system must define what conditions constitute operational synchronization between human structures.

Minimum requirement:

- synchronization conditions are explicit

symbolic labels alone are not treated as sufficient proof of independence or interdependence operational consequence remains structurally reviewable

Synchronization conditions may include:

- shared economic survival
- coordinated resource dependency
- synchronized infrastructure use
- shared operational continuity
- mutual dependency propagation
- survival consequence synchronization
- coordinated caregiving conditions
- long-term operational reliance

Under RBM, operational synchronization is determined structurally rather than symbolically.

Step 3 — Define Human Interdependence Interpretation Logic

The system must define how operational synchronization between human systems is interpreted.

Minimum requirement:

- interpretation logic is explicit

formal separation alone is not automatically treated as termination of synchronization continuing operational dependency remains structurally reviewable

Interpretation logic may examine:

- dependency continuity
- shared operational consequence
- synchronized survival conditions
- infrastructure sharing
- economic interdependence
- caregiving continuity
- coordinated operational behavior
- persistence of synchronized external pressure
- RBM prioritizes operational reality over symbolic separation alone.

Step 4 — Define Relationship Boundary Governance Logic

The system must define how synchronized human operational states remain governable.

Minimum requirement:

- governance logic is explicit

operational synchronization remains interpretable across changing structural conditions fragmentation conditions remain reviewable where dependency continuity persists

Governance mechanisms may include:

- synchronization reassessment
- dependency review
- fragmentation interpretation
- operational-boundary verification
- continuity evaluation
- cascading consequence analysis
- synchronized-risk visibility
- operational dependency review procedures

The objective is not behavioral control.

The objective is operational synchronization visibility.

Step 5 — Preserve Traceability and Restrict Invalid Symbolic Separation

The system must preserve traceability of synchronization conditions, fragmentation transitions, and dependency continuity.

Minimum requirement:

- synchronization findings remain reviewable
- operational continuity remains reconstructable
- fragmentation conditions remain interpretable
- invalid symbolic separation remains identifiable

A system becomes RBM-invalid if:

- operational synchronization remains structurally hidden
- symbolic fragmentation conceals continuing dependency continuity
- synchronized survival conditions remain operationally invisible

formal separation is used to simulate complete operational independence despite materially shared consequence dependency propagation cannot be meaningfully interpreted Operational fragmentation does not automatically terminate operational synchronization.

Use Case 1 — Shared Operational Continuity after Formal Separation

Scenario

Two individuals formally separate while continuing to share:

- economic dependency
- operational infrastructure
- coordinated resource management
- caregiving structures
- and synchronized survival conditions

Application

RBM is used to ensure:

- continuing operational synchronization remains reviewable
 - symbolic separation is distinguished from operational fragmentation
 - dependency continuity remains structurally visible
 - synchronized operational consequence remains interpretable
-

Result

The environment gains a stronger operational-boundary architecture capable of interpreting real dependency continuity beyond formal structural labels alone.

Use Case 2 — Long-Term Shared Survival Structure

Scenario

A long-term human operational structure functions through deeply synchronized economic, infrastructural, and survival conditions where disruption affecting one participant materially propagates throughout the shared environment.

Application

RBM is used to ensure:

- synchronization intensity remains visible
 - dependency pathways remain reviewable
 - cascading consequence conditions remain interpretable
 - operational interdependence remains structurally governable
-

Result

The environment gains a stronger methodology for interpreting shared operational consequence within synchronized human systems.

Canonical Closing Statement

RBM defines the structural conditions under which human operational systems become synchronized through shared dependency, survival continuity, coordinated infrastructure, and cascading operational consequence.

As modern human environments increasingly operate through interconnected economic, caregiving, and survival structures, operational interdependence becomes a structurally real

synchronization condition requiring visibility beyond symbolic relationship labels alone.
