

DECM — Delegated Execution Coordination Module

Parent Standard: Operational Dependency & Coordination Standard (ODCS)

Category: Governance & Enforcement

Subcategory: Delegated Execution Coordination

Type: Operational Dependency & Coordination Module

Version: 1.0

Status: Canonical · Open Module

Effective Date: 17 May 2026

Compatibility: OOF Methodology OS · Operational Dependency & Coordination Standard (ODCS) · Operational Reality Standard (ORS) · Runtime Integrity Standard (RIS) · Operational Evidence & Auditability Standard (OEAS) · Semantic Integrity Standard (SEIS) · Authority & Accountability Layer Standard (AALS) · INTEGROS® — Integrity Standard · Multi-Layer Truth Validation Framework (MTVF) · Ethical Virtual Integrity Protocol (EVIP)

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Delegated Execution Coordination Module (DECM) defines the structural conditions under which delegated operational execution remains materially coordinated, governable, traceable, and operationally aligned across runtime delegation chains, orchestration environments, interconnected execution systems, and consequence-bearing operational infrastructures.

A system satisfies DECM only if:

- delegated execution remains operationally coordinated
- delegation continuity remains governable
- runtime delegation chains remain traceable
- delegated operational interaction preserves coordination integrity
- consequence-bearing delegated execution remains materially aligned

A system that preserves delegated activity while delegated coordination materially fragments does not satisfy DECM.

Module Operational Role

DECM defines the delegated execution coordination layer of operational coordination governance by preserving stable delegated operational continuity across runtime delegation environments.

Module Operational Space

DECM governs the delegated execution coordination space of ODCS by preserving delegated runtime coordination continuity, orchestration delegation stability, operational delegation traceability, distributed execution alignment, and consequence-bearing delegated operational continuity across interconnected operational systems.

Module Function

The module applies wherever systems must preserve:

- delegated execution coordination
- runtime delegation continuity
- orchestration delegation stability
- distributed execution alignment
- delegated operational traceability
- consequence-bearing delegated continuity

Its function is to ensure that delegated operational execution remains materially coordinated strongly enough to preserve governable operational continuity across runtime delegation environments.

Minimum Implementation Framework

1. Define the Delegated Execution Object

The organization must define which delegated operational relationships require coordination preservation.

This may include:

- delegated runtime execution
 - orchestration delegation chains
 - distributed execution relationships
 - delegated authority interactions
 - operational coordination chains
 - synchronized delegated actions
 - consequence-bearing delegated execution states
-

2. Define Delegated Coordination Conditions

The system must define the conditions under which delegated execution remains materially coordinated and operationally aligned.

This includes:

- delegation continuity
 - runtime coordination stability
 - orchestration delegation continuity
 - distributed execution alignment
 - delegated operational traceability
-

3. Define Delegation Fragmentation Detection Logic

The system must define how materially unstable delegated coordination or delegation fragmentation is identified.

This may include:

- broken delegation chains
- unstable runtime delegation
- orchestration delegation drift
- hidden delegated execution divergence
- consequence-bearing delegation instability

4. Define Operational Response or Governance Logic

The system must define governance logic for materially unstable delegated coordination conditions.

Governance response may include:

- delegation escalation
- runtime restriction
- orchestration narrowing
- delegated execution review activation
- delegation stabilization enforcement
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of delegated coordination continuity and delegation-fragmentation states. A system must not remain coordination-valid if delegated execution materially fragments while systems continue assuming stable delegated operational continuity remains preserved.

Use Case 1 — Multi-Agent Delegated AI

Environment

Scenario

An AI orchestration environment delegates runtime execution across multiple autonomous agents and distributed operational systems.

Application

DECM preserves delegated execution coordination continuity across orchestration progression and runtime delegation chains.

Result

The environment gains stronger delegated coordination stability and reduced execution

fragmentation across AI operational systems.

Use Case 2 — Enterprise Delegated Workflow

Infrastructure

Scenario

An enterprise operational environment delegates execution responsibilities across multiple systems, workflows, and runtime coordination layers.

Application

DECM preserves coordinated delegated execution continuity across distributed operational infrastructures.

Result

The organization gains stronger delegation stability and reduced operational fragmentation across enterprise execution systems.

Canonical Closing Statement

If delegated operational execution cannot remain materially coordinated across runtime environments, systems may preserve delegated activity while operational coordination silently fragments underneath.
