

AADIM — Authority-Aligned Decision Integrity Module

Parent Standard: Operational Decision Integrity Standard (ODIS)

Category: Governance & Enforcement

Subcategory: Authority-Aligned Decision Governance

Type: Operational Decision Integrity Module

Version: 1.0

Status: Canonical · Open Module

Effective Date: 19 May 2026

Compatibility: OOF Methodology OS · Operational Decision Integrity Standard (ODIS) · Authority & Accountability Layer Standard (AALS) · Runtime Integrity Standard (RIS) · Operational Intent Integrity Standard (OIIS) · Operational Evidence & Auditability Standard (OEAS) · INTEGROS® — Integrity Standard · Autonomous Runtime Systems · AI Agent Infrastructures

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Authority-Aligned Decision Integrity Module (AADIM) defines the structural conditions under which runtime operational decisions, delegated decision authority, distributed decision coordination, and consequence-bearing decision states remain materially aligned with governance-valid authority conditions across operational environments.

A system satisfies AADIM only if:

- runtime operational decisions remain materially authority-aligned
- delegated decision authority preserves governance validity
- distributed decision coordination remains operationally coherent
- consequence-bearing operational decisions remain authority-traceable
- authority-invalid decision conditions do not destabilize operational
- legitimacy

A system that preserves runtime execution while operational decisions materially diverge from governance-valid authority

conditions does not satisfy AADIM.

Module Operational Role

AADIM defines the authority-aligned decision governance layer of ODIS by preserving governance-valid decision authority continuity across runtime environments.

Module Operational Space

AADIM governs the authority-aligned decision space of ODIS by preserving delegated authority continuity, runtime decision legitimacy, distributed authority coordination, consequence-bearing decision accountability, and governance-valid operational alignment across runtime systems.

Module Function

The module applies wherever systems must preserve:

- authority-aligned runtime decisions
- delegated decision legitimacy
- distributed authority coordination
- consequence-bearing decision accountability
- governance-valid operational alignment
- runtime authority traceability

Its function is to ensure that operational decisions remain materially aligned with governance-valid authority conditions strongly enough to preserve operational legitimacy across execution environments.

Minimum Implementation Framework

1. Define the Authority-Aligned Decision Object

The organization must define which operational decision structures require authority-alignment governance.

This may include:

- delegated runtime decisions
 - orchestration-level authority routing
 - autonomous operational actions
 - escalation-sensitive authority conditions
 - distributed decision hierarchies
 - consequence-bearing runtime choices
 - operational-critical decision pathways
-

2. Define Authority-Aligned Decision Conditions

The system must define the conditions under which operational decisions remain materially aligned with governance-valid authority conditions.

This includes:

- delegated authority continuity
 - runtime authority traceability
 - distributed authority coherence
 - operational legitimacy alignment
 - governance-valid decision continuity
-

3. Define Authority-Invalid Decision Detection Logic

The system must define how materially unstable authority alignment or authority-invalid operational decisions are identified.

This may include:

- delegated authority corruption
- runtime authority divergence
- distributed authority fragmentation
- escalation-sensitive authority instability
- consequence-bearing authority misalignment

4. Define Operational Response or Governance Logic

The system must define governance logic for materially unstable authority-aligned decision conditions.

Governance response may include:

- authority synchronization
- delegated authority restriction
- escalation review activation
- operational legitimacy reconstruction
- distributed coordination stabilization
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of authority-aligned decision continuity and authority-invalid decision states. A system must not remain decision-valid if runtime operational decisions materially diverge from governance-valid authority conditions while systems continue assuming operational legitimacy remains preserved.

Use Case 1 — Multi-Agent Decision

Infrastructure

Scenario

A distributed AI infrastructure continuously coordinates delegated operational decisions across autonomous runtime agents and orchestration systems.

Application

AADIM preserves governance-valid authority continuity through delegated decision governance and runtime authority alignment stabilization.

Result

The organization gains stronger operational legitimacy and reduced hidden authority-invalid

Use Case 2 — Autonomous Enterprise

Coordination Environment

Scenario

An autonomous enterprise environment continuously routes operational decisions across distributed authority layers and adaptive execution infrastructures.

Application

AADIM preserves governance-valid decision legitimacy through distributed authority coordination and delegated operational alignment governance.

Result

The environment gains stronger authority continuity and reduced operational decision-authority divergence across autonomous operational systems.

Canonical Closing Statement

If runtime operational decisions cannot remain materially aligned with governance-valid authority conditions, systems may preserve operational execution while decision legitimacy progressively separates from operational accountability.
