

CBDIM — Consequence-Bearing Decision

Parent Standard: Operational Decision Integrity Standard (ODIS)

Category: Governance & Enforcement

Subcategory: Consequence-Bearing Decision Governance

Type: Operational Decision Integrity Module

Version: 1.0

Status: Canonical · Open Module

Effective Date: 19 May 2026

Compatibility: OOF Methodology OS · Operational Decision Integrity Standard (ODIS) · Runtime Integrity Standard (RIS) · Operational Context Integrity Standard (OCIS) · Operational Intent Integrity Standard (OIIS) · Operational Evidence & Auditability Standard (OEAS) · Authority & Accountability Layer Standard (AALS) · INTEGROS® — Integrity Standard · Autonomous Runtime Systems · AI Agent Infrastructures

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Consequence-Bearing Decision Integrity Module (CBDIM) defines the structural conditions under which operational decisions affecting real operational outcomes, escalation-sensitive runtime decisions, distributed decision coordination, and consequence-bearing decision states remain materially stable, traceable, and operationally governable across runtime environments.

A system satisfies CBDIM only if:

- consequence-bearing operational decisions remain materially governable
- runtime decision outcomes preserve operational alignment
- escalation-sensitive decisions remain operationally traceable
- distributed decision coordination remains coherent
- consequence-bearing decision corruption does not destabilize operational
- continuity

A system that preserves runtime execution while operational decisions affecting real operational outcomes materially destabilize does not satisfy CBDIM.

Module Operational Role

CBDIM defines the consequence-bearing decision governance layer of ODIS by preserving governance-valid runtime decisions across operational systems affecting real operational outcomes.

Module Operational Space

CBDIM governs the consequence-bearing decision space of ODIS by preserving runtime decision legitimacy, escalation- sensitive decision continuity, distributed operational coordination, adaptive decision governance, and consequence- bearing operational alignment across runtime systems.

Module Function

The module applies wherever systems must preserve:

- consequence-bearing operational decisions
- runtime decision legitimacy
- escalation-sensitive decision continuity
- distributed operational coordination
- adaptive decision governance
- operational outcome alignment

Its function is to ensure that operational decisions affecting real operational outcomes remain materially governable strongly enough to preserve valid runtime operational alignment across execution environments.

Minimum Implementation Framework

1. Define the Consequence-Bearing Decision Object

The organization must define which operational decisions affecting real operational outcomes require governance preservation.

This may include:

- autonomous runtime decisions
 - escalation-sensitive operational actions
 - distributed orchestration decisions
 - robotics execution choices
 - adaptive operational routing
 - consequence-bearing runtime actions
 - operational-critical decision pathways
-

2. Define Consequence-Bearing Decision Conditions

The system must define the conditions under which operational decisions affecting real operational outcomes remain materially stable and operationally aligned.

This includes:

- runtime decision legitimacy
 - escalation-sensitive traceability
 - distributed coordination coherence
 - adaptive decision stability
 - governance-valid operational alignment
-

3. Define Consequence-Bearing Decision Corruption Detection Logic

The system must define how materially unstable consequence-bearing decisions or operational decision corruption is identified.

This may include:

- escalation misalignment
- operationally unjustified actions
- distributed decision fragmentation
- adaptive decision instability
- consequence-bearing decision divergence

4. Define Operational Response or Governance Logic

The system must define governance logic for materially unstable consequence-bearing decision conditions.

Governance response may include:

- escalation review
- decision stabilization
- distributed coordination synchronization
- adaptive restriction
- operational reconstruction
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of consequence-bearing decision continuity and operational decision-corruption states. A system must not remain decision-valid if operational decisions affecting real operational outcomes materially destabilize while systems continue assuming runtime decision legitimacy remains preserved.

Use Case 1 — Autonomous AI Decision

Infrastructure

Scenario

An AI infrastructure continuously generates operational decisions across adaptive runtime systems and distributed orchestration environments.

Application

CBDIM preserves governance-valid runtime decisions through escalation-sensitive decision governance and operational alignment continuity.

Result

The organization gains stronger operational decision stability and reduced hidden

consequence-bearing decision corruption across distributed AI systems.

Use Case 2 — Industrial Autonomous Control

Environment

Scenario

An autonomous industrial infrastructure continuously executes realtime operational decisions across distributed control systems and adaptive execution environments.

Application

CBDIM preserves governance-valid operational decision continuity through distributed coordination governance and consequence-bearing runtime alignment.

Result

The environment gains stronger operational predictability and reduced operational decision instability across autonomous operational systems.

Canonical Closing Statement

If operational decisions affecting real operational outcomes cannot remain materially governable across runtime environments, systems may preserve operational execution while consequence-bearing operational alignment progressively diverges from runtime legitimacy.
