

CBIIM — Consequence-Bearing Intent Integrity Module

Parent Standard: Operational Intent Integrity Standard (OIIS)

Category: Governance & Enforcement

Subcategory: Consequence-Bearing Intent Governance

Type: Operational Intent Integrity Module

Version: 1.0

Status: Canonical · Open Module

Effective Date: 18 May 2026

Compatibility: OOF Methodology OS · Operational Intent Integrity Standard (OIIS) · Operational Reality Standard (ORS) · Runtime Integrity Standard (RIS) · Operational Context Integrity Standard (OCIS) · Operational Memory Integrity Standard (OMIS) · Operational State Transition Standard (OSTS) · Operational Dependency & Coordination Standard (ODCS) · Semantic Integrity Standard (SEIS) · Operational Evidence & Auditability Standard (OEAS) · Authority & Accountability Layer Standard (AALS) · INTEGROS® — Integrity Standard · Multi-Layer Truth Validation Framework (MTVF) · Ethical Virtual Integrity Protocol (EVIP)

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Consequence-Bearing Intent Integrity Module (CBIIM) defines the structural conditions under which operational intent affecting real operational outcomes remains materially stable, traceable, semantically aligned, and operationally governable across runtime execution environments, delegated operational systems, distributed cognition infrastructures, and adaptive execution continuity.

A system satisfies CBIIM only if:

- consequence-bearing operational intent remains materially governable
- runtime intent continuity affecting operational outcomes remains stable
- delegated operational meaning preserves operational validity
- adaptive intent evolution remains operationally aligned
- consequence-bearing intent instability does not silently destabilize
- operational continuity

A system that preserves operational execution while consequence-bearing operational intent materially destabilizes does

not satisfy CBIIM.

Module Operational Role

CBIIIM defines the consequence-bearing intent governance layer of OIIS by preserving governable operational intent continuity across runtime systems affecting real operational outcomes.

Module Operational Space

CBIIIM governs the consequence-bearing intent space of OIIS by preserving operational intent accountability, semantic intent stability, adaptive intent governance continuity, distributed intent coherence, and runtime intent traceability across interconnected operational systems.

Module Function

The module applies wherever systems must preserve:

- consequence-bearing intent continuity
- runtime intent accountability
- semantic intent stability
- adaptive intent governance
- distributed intent coherence
- operational intent traceability

Its function is to ensure that operational intent affecting real operational outcomes remains materially governable strongly enough to preserve long-term operational validity across runtime environments.

Minimum Implementation Framework

1. Define the Consequence-Bearing Intent Object

The organization must define which operational intent structures affecting real operational outcomes require governance preservation.

This may include:

- persistent runtime intent
 - delegated operational objectives
 - distributed intent synchronization
 - orchestration intent continuity
 - adaptive intent evolution
 - semantic operational direction
 - consequence-bearing execution continuity
-

2. Define Consequence-Bearing Intent Conditions

The system must define the conditions under which operational intent affecting operational outcomes remains materially stable and operationally aligned.

This includes:

- runtime intent continuity
-

- semantic intent stability
 - adaptive governance continuity
 - synchronization coherence
 - operational objective traceability
-

3. Define Consequence-Bearing Intent Instability Detection Logic

The system must define how materially unstable consequence-bearing intent conditions or intent divergence is identified.

This may include:

- semantic intent corruption
 - optimization-induced drift
 - delegation fragmentation
 - adaptive intent instability
 - consequence-bearing operational divergence
-

4. Define Operational Response or Governance Logic

The system must define governance logic for materially unstable consequence-bearing intent conditions.

Governance response may include:

- intent escalation
 - semantic review activation
 - synchronization stabilization
 - adaptive execution restriction
 - operational objective reconstruction
 - operational invalidation where required
-

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of consequence-bearing intent continuity and intent-instability states. A system must not remain intent-valid if operational intent affecting real operational outcomes materially destabilizes while systems continue assuming stable operational continuity remains preserved.

Use Case 1 — Autonomous Enterprise AI

Infrastructure

Scenario

A distributed enterprise AI infrastructure continuously evolves operational execution across orchestration systems and autonomous runtime environments affecting real operational outcomes.

Application

CBIIIM preserves governable operational intent continuity through semantic intent governance and adaptive execution stability protection.

Result

The organization gains stronger operational accountability and reduced hidden intent instability across distributed AI systems.

Use Case 2 — Distributed Robotics Coordination

Environment

Scenario

A distributed robotics environment continuously synchronizes operational objectives across adaptive runtime systems and autonomous coordination infrastructures.

Application

CBIIIM preserves stable consequence-bearing intent continuity across synchronized operational environments.

Result

The environment gains stronger operational predictability and reduced distributed intent divergence across autonomous operational systems.

Canonical Closing Statement

If operational intent affecting real operational outcomes cannot remain materially governable across runtime evolution, systems may preserve operational execution while long-term operational validity silently destabilizes underneath.
