

DIM — Delegated Intent Integrity Module

Parent Standard: Operational Intent Integrity Standard (OIIS)

Category: Governance & Enforcement

Subcategory: Delegated Intent Integrity

Type: Operational Intent Integrity Module

Version: 1.0

Status: Canonical · Open Module

Effective Date: 18 May 2026

Compatibility: OOF Methodology OS · Operational Intent Integrity Standard (OIIS) · Operational Reality Standard (ORS) · Runtime Integrity Standard (RIS) · Operational Context Integrity Standard (OCIS) · Operational Memory Integrity Standard (OMIS) · Operational State Transition Standard (OSTS) · Operational Dependency & Coordination Standard (ODCS) · Semantic Integrity Standard (SEIS) · Operational Evidence & Auditability Standard (OEAS) · Authority & Accountability Layer Standard (AALS) · INTEGROS® — Integrity Standard · Multi-Layer Truth Validation Framework (MTVF) · Ethical Virtual Integrity Protocol (EVIP)

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Delegated Intent Integrity Module (DIM) defines the structural conditions under which delegated operational intent, transferred execution objectives, orchestration-level intent propagation, adaptive delegation continuity, and consequence-bearing delegated execution remain materially stable, traceable, and operationally governable across runtime execution environments.

A system satisfies DIM only if:

- delegated operational intent remains materially stable
- transferred execution objectives preserve operational alignment
- orchestration-level delegation remains governable
- adaptive delegation continuity preserves intended operational meaning
- delegated intent distortion does not silently destabilize operational
- continuity

A system that preserves delegated execution while operational intent materially diverges during delegation does not satisfy DIM.

Module Operational Role

DIM defines the delegated intent integrity layer of OIIS by preserving stable operational intent continuity across delegated execution environments.

Module Operational Space

DIM governs the delegated intent integrity space of OIIS by preserving delegated operational meaning continuity, orchestration-level intent propagation stability, adaptive delegation coherence, distributed intent transfer alignment, and consequence-bearing delegated execution continuity across operational systems.

Module Function

The module applies wherever systems must preserve:

- delegated intent continuity
- transferred execution alignment
- orchestration delegation stability
- adaptive delegation coherence
- distributed intent propagation
- consequence-bearing delegated execution continuity

Its function is to ensure that delegated operational intent remains materially stable strongly enough to preserve valid operational continuity across runtime execution environments.

Minimum Implementation Framework

1. Define the Delegated Intent Object

The organization must define which delegated operational intent structures require governance preservation.

This may include:

- delegated execution objectives
 - orchestration-level intent transfer
 - adaptive delegation continuity
 - distributed intent propagation
 - semantic delegation inheritance
 - runtime operational delegation
 - consequence-bearing delegated execution
-

2. Define Delegated Intent Integrity Conditions

The system must define the conditions under which delegated operational intent remains materially stable and operationally aligned.

This includes:

- delegation continuity stability
 - transferred objective coherence
-

- adaptive delegation alignment
 - distributed delegation continuity
 - operational meaning preservation
-

3. Define Delegated Intent Distortion Detection Logic

The system must define how materially unstable delegated intent or delegation distortion is identified.

This may include:

- transferred objective divergence
 - orchestration delegation corruption
 - adaptive delegation instability
 - distributed intent fragmentation
 - consequence-bearing delegation mismatch
-

4. Define Operational Response or Governance Logic

The system must define governance logic for materially unstable delegated intent conditions.

Governance response may include:

- delegation escalation
 - semantic review activation
 - orchestration stabilization
 - adaptive delegation restriction
 - execution realignment enforcement
 - operational invalidation where required
-

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of delegated intent continuity and delegated-intent distortion states. A system must not remain intent-valid if delegated operational intent materially diverges while systems continue assuming stable operational meaning remains preserved.

Use Case 1 — Multi-Agent Orchestration

Infrastructure

Scenario

A distributed AI orchestration environment continuously delegates operational execution across autonomous agents and adaptive runtime systems.

Application

DIM preserves stable delegated intent continuity through orchestration governance and transferred objective alignment.

Result

The organization gains stronger delegated execution consistency and reduced hidden delegation distortion across distributed AI systems.

Use Case 2 — Autonomous Robotics

Coordination

Scenario

An autonomous robotics infrastructure continuously transfers operational objectives across distributed execution environments and adaptive control layers.

Application

DIM preserves stable operational delegation continuity through distributed intent propagation governance and adaptive execution alignment.

Result

The environment gains stronger execution predictability and reduced delegated intent divergence across autonomous operational systems.

Canonical Closing Statement

If delegated operational intent cannot remain materially stable across runtime execution environments, systems may preserve delegated execution while long-term operational validity silently destabilizes underneath.
