

APSM — Adaptive Perception Stability Module

Parent Standard: Operational Perception Integrity Standard (OPIS)

Category: Governance & Enforcement

Subcategory: Adaptive Perception Stability

Type: Operational Perception Integrity Module

Version: 1.0

Status: Canonical · Open Module

Effective Date: 19 May 2026

Compatibility: OOF Methodology OS · Operational Perception Integrity Standard (OPIS) · Runtime Integrity Standard (RIS) · Operational Context Integrity Standard (OCIS) · Operational Attention Governance Standard (OAGS) · Semantic Integrity Standard (SEIS) · Operational Evidence & Auditability Standard (OEAS) · INTEGROS® — Integrity Standard · Autonomous Runtime Systems · Adaptive AI Infrastructures

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Adaptive Perception Stability Module (APSM) defines the structural conditions under which adaptive operational perception, runtime perception evolution, dynamic sensory interpretation, distributed adaptive perception synchronization, and consequence-bearing adaptive perception states remain materially stable, traceable, and operationally governable across adaptive runtime environments.

A system satisfies APSM only if:

- adaptive operational perception remains materially stable
- runtime perception evolution preserves operational alignment
- dynamic sensory interpretation remains governance-compatible
- distributed adaptive perception synchronization remains coherent
- adaptive perception drift does not silently destabilize operational
- continuity

A system that preserves runtime execution while adaptive operational perception materially destabilizes does not satisfy APSM.

Module Operational Role

APSM defines the adaptive perception stability layer of OPIS by preserving governance-valid adaptive runtime perception continuity across operational environments.

Module Operational Space

APSM governs the adaptive perception stability space of OPIS by preserving runtime perception continuity, dynamic sensory interpretation stability, distributed adaptive perception coherence, operational reality alignment, and consequence-bearing adaptive perception governance across runtime systems.

Module Function

The module applies wherever systems must preserve:

- adaptive perception stability
- runtime perception continuity
- dynamic sensory interpretation
- distributed adaptive perception coherence
- operational reality alignment
- consequence-bearing adaptive perception continuity

Its function is to ensure that adaptive operational perception remains materially stable strongly enough to preserve governance-valid runtime operational reality interpretation across execution environments.

Minimum Implementation Framework

1. Define the Adaptive Perception Object

The organization must define which adaptive operational perception structures require stability governance.

This may include:

- adaptive sensory interpretation
 - dynamic runtime perception
 - multimodal adaptive sensing
 - distributed adaptive perception systems
 - realtime environmental adaptation
 - orchestration-level adaptive perception
 - consequence-bearing runtime sensing
-

2. Define Adaptive Perception Stability Conditions

The system must define the conditions under which adaptive operational perception remains materially stable and operationally aligned.

This includes:

- runtime perception continuity
 - adaptive interpretation stability
 - distributed sensory synchronization
 - operational reality alignment
 - governance-valid adaptive perception
-

3. Define Adaptive Perception Drift Detection Logic

The system must define how materially unstable adaptive perception or adaptive perception drift is identified.

This may include:

- dynamic sensory instability
- adaptive operational hallucination
- distributed perception fragmentation
- runtime perception corruption
- consequence-bearing perception divergence

4. Define Operational Response or Governance Logic

The system must define governance logic for materially unstable adaptive-perception conditions.

Governance response may include:

- perception stabilization
- adaptive recalibration
- distributed synchronization restoration
- runtime perception restriction
- operational review activation
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of adaptive-perception continuity and adaptive-perception drift states. A system must not remain perception-valid if adaptive operational perception materially destabilizes while systems continue assuming runtime operational reality alignment remains preserved.

Use Case 1 — Adaptive Autonomous Robotics

Infrastructure

Scenario

An autonomous robotics environment continuously adapts runtime perception across multimodal sensors and realtime environmental interaction systems.

Application

APSM preserves governance-valid adaptive perception through runtime perception stabilization and distributed sensory alignment governance.

Result

The environment gains stronger adaptive operational perception continuity and reduced hidden

Use Case 2 — Distributed Adaptive Monitoring

Environment

Scenario

A distributed monitoring infrastructure continuously adapts operational sensing across realtime environmental conditions and adaptive runtime systems.

Application

APSM preserves governance-valid adaptive perception continuity through dynamic sensory interpretation governance and operational reality alignment stabilization.

Result

The organization gains stronger runtime perception stability and reduced adaptive operational perception corruption across distributed sensing infrastructures.

Canonical Closing Statement

If adaptive operational perception cannot remain materially stable across runtime environments, systems may preserve operational execution while operational reality silently destabilizes underneath.
