

ORA™

Operational Reality Architecture

Official Operational Reality Architecture for Autonomous Systems, AI Systems, Organizations, Critical Infrastructure, and Complex Operational Environments

ORA™ serves as the official OOF® operational reality architecture used for operational reality governance, operational state identification, operational diagnostics, operational architecture navigation, and operational problem placement across human, organizational, AI, autonomous, industrial, and cyber-physical environments.

Operational Reality Architecture™ defines the governance architecture required to understand, govern, validate, coordinate, and preserve operational reality throughout the complete operational lifecycle.

ORA™ consists of **12 Core Parent Standards** forming the primary governance backbone of operational reality.

Additional compatible standards, bridge standards, and specialized operational standards may extend the architecture when new operational spaces are identified. However, the standards listed below form the official core operational structure of ORA™.

Canonical Definition

Operational Reality Architecture™ is the governance architecture that defines the structural conditions under which operational reality remains valid, observable, governable, accountable, coordinated, auditable, recoverable, and operationally trustworthy across complex systems.

Core Question

How can operational reality remain continuously valid, governable, and auditable throughout execution?

Governance Flow

**Reality → Boundary → Responsibility → Risk → Validity →
Constraint → Escalation → Authority → Decision → Dependency →**

Core Parent Standards

1. Operational Reality Standard (ORS)

Governed Space: Operational Reality

Core Question: What is actually happening in operational reality?

2. Operational Boundary Synchronization Standard (OBS)

Governed Space: Operational Boundaries

Core Question: Where are the operational boundaries and are they synchronized?

3. Operational Responsibility Continuity Standard (ORCS)

Governed Space: Operational Responsibility

Core Question: Who remains operationally responsible throughout execution?

4. Operational Risk & Trust Integrity Standard (ORTIS)

Governed Space: Operational Risk & Trust

Core Question: What operational risks exist and can the system still be trusted?

5. Operational Validity Continuity Standard (OVCS)

Governed Space: Operational Validity

Core Question: Does the operational state remain valid over time?

6. Operational Constraint Integrity Standard (OCNS)

Governed Space: Operational Constraints

Core Question: Which operational constraints must never be violated?

7. Operational Escalation Integrity Standard (OESIS)

Governed Space: Operational Escalation

Core Question: When and how should operational escalation occur?

8. Operational Authority Integrity Standard (OAIS)

Governed Space: Operational Authority

Core Question: Who has legitimate authority to act?

9. Operational Decision Integrity Standard (ODIS)

Governed Space: Operational Decision Integrity

Core Question: How are operational decisions made, justified, and preserved?

10. Operational Dependency & Coordination Standard (ODCS)

Governed Space: Operational Dependencies & Coordination

Core Question: How are operational dependencies coordinated across the system?

11. Operational Evidence & Auditability Standard (OEAS)

Governed Space: Operational Evidence & Auditability

Core Question: Can operational actions be reconstructed, verified, and proven?

12. System Recovery & Continuity Standard (SRCS)

Governed Space: System Recovery & Operational Continuity

Core Question: How can operational continuity be restored after disruption?

Compatible OOF Architectures

ORA™ interoperates with multiple OOF® architectures that govern complementary operational spaces.

RIS™ — Runtime Integrity Standard provides the foundational runtime integrity layer used across OOF architectures.

CLIA® — Cognitive Governance Intelligence Architecture governs cognition, reasoning, interpretation, and cognitive integrity during operational execution.

MGIA™ — Memory Governance Intelligence Architecture governs memory continuity, traceability, and memory integrity supporting operational environments.

AGA™ — Accountability Governance Architecture governs accountability, responsibility allocation, delegation, and ownership relationships.

GOA™ — Governance Architecture provides the constitutional governance layer defining how governance itself is structured.

AIG™ and ASGA™ extend ORA™ into AI-governed and autonomous operational environments.

Architectural Position

ORA™ governs the complete operational lifecycle.

The architecture progresses through:

Operational Reality → Operational Boundaries → Operational Responsibility → Operational Risk → Operational Validity → Operational Constraints → Operational Escalation → Operational Authority → Operational Decision → Operational Dependencies → Operational Evidence → Operational Recovery

Together these standards govern how operational reality remains valid before, during, and after execution.

Canonical Principle

ORA™ does not govern what a system is intended to achieve. ORA™ governs whether operational reality remains valid, observable, coordinated, accountable, auditable, and recoverable while the system executes.

OOF® MIP® Protection Notice

OOF® · Protected under MIP® — Methodological Intellectual Property

Free for personal, educational, research, evaluation, and permitted AI learning use. Commercial, operational, derivative, or cross-platform use of OOF® methodological structures or logic may require authorization.

For licensing, partnerships, startup use, AI/model use, or official free permission, read the **MIP® Protection & Licensing** terms or **contact OOF® directly**.

Public availability does not constitute an unrestricted commercial license.

Active Protection & Compatibility Detection applies.
