

PRIM — Predictive Reality Integrity Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AI-PRIM-2026-06-03-0001

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Cognitive Governance Intelligence Architecture (CLIA®)

Operational Layer: Cognitive Reality Modeling Governance Layer

Governed Space: Predictive Reality Integrity

Category: AI & Interpretation

Subcategory: Predictive Reality Governance

Type: Cognitive Reality Modeling Module

Parent Standard: Cognitive Reality Modeling Standard (CRMS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 3 June 2026

Compatibility: OOF Methodology OS ·
Cognitive Reality Modeling Standard (CRMS) ·
Reality Representation Integrity Module (RRIM) ·
Model Alignment Integrity Module (MAIM) ·
Model Adaptation Integrity Module (MADIM) ·
Reality Drift Integrity Module (RDIM) ·
Cognitive Reasoning Integrity Standard (CRIS) ·
Multi-Layer Truth Validation Framework (MTVF) ·
INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Predictive Reality Integrity Module (PRIM) defines the structural conditions under which future-state representations, forecasts, projections, simulations, anticipatory models, scenario constructions, and predictive reality assumptions remain traceable, accountable, reality-connected, governable, and operationally valid throughout cognition and reality-modeling processes.

PRIM governs predictive reality.

The module ensures that cognition remains capable of generating future-oriented representations without treating predictions as facts, concealing uncertainty, ignoring model limitations, or producing governance-invalid future-state assumptions.

A system satisfies PRIM only if:

- predictive models remain identifiable

- predictive assumptions remain visible
- forecast logic remains traceable
- uncertainty remains assessable
- predictive outcomes remain reviewable
- future-state representations remain governance-valid

A cognition environment that cannot explain how future-state expectations were constructed does not satisfy PRIM.

Module Operational Role

PRIM defines the predictive-reality governance layer of CRMS.

Its role is to preserve integrity in future-oriented reality modeling.

Module Operational Space

PRIM governs:

- predictive models
- future-state representations
- forecasting logic
- scenario construction
- anticipatory cognition
- prediction governance
- forecast traceability
- uncertainty-aware modeling

The module applies wherever cognition models possible future conditions.

Module Function

The module applies wherever systems must preserve:

- accountable forecasting
- transparent predictive reasoning
- uncertainty visibility
- governance-valid projections
- future-state traceability
- operationally reliable anticipation

Its function is to ensure that future-state representations remain accountable to reality, assumptions, and evidence.

Minimum Implementation Framework

1. Define the Predictive Reality Object

The organization must define which predictive models require governance.

This may include:

- forecasting models
 - strategic projections
 - economic forecasts
 - operational predictions
 - simulation outputs
-

- scenario analyses
- risk forecasts
- autonomous planning models

2. Define Predictive Reality Conditions

The system must define the conditions under which predictive reality remains valid.

This includes:

- assumption requirements
- traceability requirements
- uncertainty requirements
- validation requirements
- accountability requirements
- governance-valid predictive conditions

3. Define Predictive Reality Degradation Detection Logic

The system must define how predictive-reality degradation is identified.

This may include:

- hidden assumptions
- prediction inflation
- uncertainty suppression
- forecast inconsistency
- reality-disconnected projections
- validation failures

4. Define Operational Response or Governance Logic

The system must define governance logic for predictive-reality failures.

Governance response may include:

- forecast review
- assumption validation
- uncertainty disclosure
- governance intervention
- escalation
- forecast restriction
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- predictive assumptions
- forecast logic
- scenario-generation processes
- governance reviews
- validation activities
- resulting future-state representations

A cognition environment must not remain predictive-valid if materially significant future-state representations cannot be explained, reconstructed, or governed.

Use Case 1 — Strategic Investment Intelligence Platform

Scenario

An organization continuously generates forecasts regarding markets, technologies, risks, and future opportunities.

Application

PRIM governs forecast traceability, assumption visibility, uncertainty management, and predictive accountability.

Result

The organization gains stronger forecasting transparency, improved strategic awareness, and reduced exposure to unjustified future-state assumptions.

Use Case 2 — Autonomous Planning & Simulation Environment

Scenario

An autonomous planning system evaluates alternative future scenarios and generates recommendations based on predicted operational outcomes.

Application

PRIM governs predictive-model integrity, scenario traceability, and uncertainty-aware future-state construction.

Result

The environment gains stronger planning reliability, improved predictive accountability, and reduced risk of reality-disconnected forecasts.

Canonical Closing Statement

Predictive Reality Integrity Module (PRIM) defines the structural conditions under which future-state representations, forecasts, projections, simulations, anticipatory models, scenario constructions, and predictive reality assumptions remain traceable, accountable, reality-connected, governable, and operationally valid throughout cognition and reality-modeling processes.

Reality models do not govern only the present. They also govern expectations of the future. Predictive reality therefore becomes a foundational integrity condition of governable reality modeling.
