Index™ (PSII™) Assessing Governance Integrity During Real-World Operation

Modern systems do not remain static after deployment.

AI systems, autonomous agents, digital workflows, operational platforms, and intelligent infrastructures continuously make decisions, execute actions, interact with users, process exceptions, and adapt to changing operational conditions.

Runtime Integrity Assessment exists to evaluate whether governance integrity remains preserved during real-world operation.

This Question Index provides a structured collection of questions designed to support runtime behavior evaluation, governance integrity assessment, operational reality analysis, runtime evidence review, drift detection, audit traceability, and long-term governance improvement.

The objective is not to verify what the system was intended to do.

The objective is to verify what the system actually does.

Runtime Operation

How does the system operate under real-world conditions? Does runtime behavior match intended governance requirements? Can system behavior be observed during operation? Can runtime decisions be reconstructed? Are runtime actions consistent with documented rules? Does the system behave differently after deployment? Are runtime conditions changing over time? Can operational deviations be detected? Does the system remain governable during runtime? Can runtime behavior be independently assessed?

Governance Integrity

Is governance integrity preserved during operation? Are governance rules followed at runtime? Are governance boundaries respected? Are authority limits maintained? Are accountability conditions preserved? Are responsibility relationships traceable? Can governance compliance be demonstrated? Can governance failures be identified during operation? Does runtime behavior create governance gaps? Is governance integrity measurable?

Operational Reality

What actually happens during real-world operation? Does operational reality match system design? Does operational reality match

documentation? Does operational reality match management assumptions? Can operational reality be verified through evidence? Are operational deviations documented? Can operational reality reveal hidden risks? Can operational reality reveal governance weaknesses? Can operational reality reveal behavioral drift? Is operational reality sufficiently understood?

Runtime Evidence

What runtime evidence is available? Are runtime logs complete? Are decision records preserved? Are event histories accessible? Are audit trails reliable? Are exception records documented? Are escalation records preserved? Can runtime evidence be independently reviewed? Can runtime evidence support accountability? Is runtime evidence sufficient for assessment?

Behavioral Drift

Has the system drifted from intended behavior? Can behavioral drift be detected? Can behavioral drift create governance risk? Can AI behavior change over time? Can autonomous agents develop unexpected behavior? Are runtime deviations increasing? Can drift be measured? Can drift be explained? Can drift be corrected? Does behavioral drift affect trust?

Decision Consistency

Are runtime decisions consistent? Are similar situations handled consistently? Can decision inconsistency be detected? Are decision pathways traceable? Are decision criteria preserved during operation? Can AI decisions be explained after execution? Can autonomous decisions be reviewed? Are high-risk decisions escalated properly? Can decision failures be reconstructed? Does decision behavior remain aligned with governance rules?

Boundary Compliance

Does the system respect operational boundaries? Does the system respect authority boundaries? Does the system respect human oversight boundaries? Does the system respect safety boundaries? Does the system respect regulatory boundaries? Can boundary violations be detected? Are boundary exceptions documented? Can boundary compliance be audited? Can runtime boundary failures create risk? Are boundary controls effective during operation?

Human Oversight

Is human oversight preserved during runtime? Can humans intervene when required? Are override mechanisms functional? Are escalation pathways working? Are human review points documented? Does the system bypass human oversight? Are oversight responsibilities clearly assigned? Can oversight failures be identified? Is human control preserved under real-world conditions? Does runtime

Runtime Risk

What risks appear during runtime operation? Are runtime risks different from design-stage risks? Can runtime risks be monitored continuously? Can runtime risks escalate over time? Can runtime failures create governance exposure? Can runtime behavior create liability risk? Can operational deviations increase risk? Can hidden runtime risks be discovered? Are runtime risk controls effective? Can runtime risk be reduced through governance improvement?

Runtime Integrity Outcomes

What defines successful runtime integrity? Can runtime integrity improve organizational trust? Can runtime integrity improve AI governance? Can runtime integrity improve autonomous system governance? Can runtime integrity improve operational transparency? Can runtime integrity support audit readiness? Can runtime integrity strengthen accountability? Can runtime integrity improve governance maturity? Can runtime integrity become a continuous assessment capability? Can Runtime Integrity Assessment become essential for future intelligent systems?

Related OOF® Service

Runtime Integrity Assessment

Runtime Integrity Assessment helps organizations independently evaluate whether governance integrity remains preserved during the real-world operation of AI systems, autonomous agents, digital processes, operational environments, and intelligent infrastructures.

This service is exceptional because it does not assess only design, intention, or documentation.

It evaluates operational reality.

About the OOF Problem Space Intelligence Index™

The OOF Problem Space Intelligence Index™ (PSII™) is a growing collection of structured questions designed to help identify, understand, classify, and investigate problems before searching for solutions.

Questions are organized into categories, clusters, and problem environments to improve clarity, analysis, governance, and decision-making.

The objective is not merely to provide answers.

The objective is to ensure that the right questions are being asked.
