

RCIM — Reasoning Consistency Integrity Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AI-RCIM-2026-06-03-0001

Architecture Ecosystem: Cognitive Governance Intelligence Architecture (CLIA®)

Architecture Family: Core Cognition Governance

Operational Layer: Cognitive Validity Layer

Governed Space: Reasoning Consistency Integrity

Category: AI & Interpretation

Subcategory: Cognitive Reasoning Governance

Type: Cognitive Integrity Module

Parent Standard: Cognitive Integrity Standard (CIS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 3 June 2026

Compatibility: OOF Methodology OS ·

Cognitive Integrity Standard (CIS) ·

Multi-Layer Truth Validation Framework (MTVF) ·

Operational Decision Integrity Standard (ODIS) ·

INTEGROS® — Integrity Standard ·

Universal Canonical Language (UCL)

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Reasoning Consistency Integrity Module (RCIM) defines the structural conditions under which reasoning remains logically coherent, contradiction-controlled, traceable, self-correctable, and materially aligned with valid cognition across human, AI, agent, collective, and future cognitive systems.

RCIM governs reasoning consistency.

The module ensures that cognition remains capable of preserving coherent reasoning without accumulating unresolved contradictions, invalid assumptions, or structurally unstable reasoning paths.

A system satisfies RCIM only if:

- reasoning remains coherent
- contradictions remain detectable
- reasoning paths remain traceable
- correction remains possible
- invalid assumptions remain governable

- reasoning stability remains materially preservable

A cognition system that permits unresolved contradictions or structurally unstable reasoning does not satisfy RCIM.

Module Operational Role

RCIM defines the reasoning-consistency layer of CIS.

Its role is to preserve cognition validity by ensuring that reasoning remains internally coherent and operationally reliable.

Module Operational Space

RCIM governs:

- reasoning consistency
- contradiction governance
- assumption integrity
- reasoning traceability
- reasoning correction
- logical coherence
- reasoning-path stability
- cognition reliability

The module applies wherever cognition depends on reasoning processes to generate conclusions, interpretations, assessments, or decisions.

Module Function

The module applies wherever systems must preserve:

- coherent reasoning
- contradiction control
- traceable cognition
- reasoning stability
- correction capability
- governance-valid conclusions

Its function is to ensure that cognition remains logically stable even when complexity, uncertainty, or information volume increases.

Minimum Implementation Framework

1. Define the Reasoning Object

The organization must define which reasoning processes require governance.

This may include:

- analytical reasoning
 - decision-support reasoning
 - interpretive reasoning
 - autonomous agent reasoning
 - strategic reasoning
 - collective reasoning
 - human-AI reasoning
-

- multi-agent reasoning

2. Define Reasoning Consistency Conditions

The system must define the conditions under which reasoning remains valid.

This includes:

- contradiction limits
- coherence requirements
- traceability requirements
- correction requirements
- assumption-validation conditions
- reasoning-stability requirements

3. Define Contradiction & Inconsistency Detection Logic

The system must define how reasoning inconsistencies are identified.

This may include:

- contradiction detection
- assumption conflict detection
- reasoning-path comparison
- coherence analysis
- logical conflict monitoring
- conclusion-consistency evaluation

4. Define Operational Response or Governance Logic

The system must define governance logic for inconsistent reasoning conditions.

Governance response may include:

- contradiction review
- reasoning correction
- confidence reduction
- escalation
- cognition restriction
- governance intervention
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- reasoning paths
- contradiction events
- correction actions
- assumption changes
- governance interventions
- conclusion-generation processes

A cognition system must not remain reasoning-valid if unresolved contradictions materially influence cognition outcomes.

Use Case 1 — Autonomous Decision-Support System

Scenario

An autonomous decision-support environment continuously evaluates large volumes of information and generates recommendations for operational use.

Application

RCIM governs reasoning consistency, contradiction control, and correction logic before conclusions become operationally influential.

Result

The system gains stronger reasoning reliability and reduced exposure to contradiction-driven decision failures.

Use Case 2 — Human-AI Strategic Analysis Environment

Scenario

Humans and AI jointly perform analysis, forecasting, interpretation, and planning under uncertainty.

Application

RCIM governs reasoning coherence and contradiction management across human and machine cognition processes.

Result

The environment gains stronger analytical integrity, improved conclusion reliability, and reduced risk of unstable reasoning paths.

Canonical Closing Statement

Reasoning Consistency Integrity Module (RCIM) defines the structural conditions under which reasoning remains logically coherent, contradiction-controlled, traceable, self-correctable, and materially aligned with valid cognition across human, AI, agent, collective, and future cognitive systems.

Cognition cannot remain valid if reasoning becomes contradictory.
Reasoning consistency therefore becomes a foundational integrity condition of governable cognition.
