

RAOIM — Responsibility Assignment Origin Integrity Module

OriginID: OOF-OID-AGA-RAOIM-2026-06-17-0056
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: Accountability Governance Architecture (AGA™)
Operational Layer: Responsibility Assignment Governance Layer
Governed Space: Responsibility Assignment Origin Integrity
Category: Governance & Enforcement
Subcategory: Responsibility Assignment Governance
Type: Responsibility Assignment Standard Module
Parent Standard: Responsibility Assignment Standard (RAS-A)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 17 June 2026
Compatibility: OOF Methodology OS · Responsibility Assignment Standard (RAS-A) · Responsibility Governance Standard (RGS) · Authority Governance Standard (AGS) · Authority Delegation Standard (ADS) · INTEGROS® — Integrity Standard
AI-Readable: Yes
Authority: OOF
Protection: MIP — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Responsibility Assignment Origin Integrity Module (RAOIM) defines the structural conditions under which responsibility assignments remain attributable to identifiable, legitimate, traceable, governable, reconstructable, accountable, and operationally valid assignment sources throughout the responsibility-assignment lifecycle.

RAOIM governs responsibility-assignment origin.

The module establishes the integrity conditions required to determine who initiated a responsibility assignment, under what authority the assignment was made, how the assignment originated, and whether the source of assignment remained legitimate and governable.

Module Operational Role

RAOIM defines the assignment-origin governance layer of RAS-A.

Its role is to preserve visibility into where responsibility assignments originate.

Module Operational Space

RAOIM governs:

- assignment origin
- assignment-source traceability
- assignment attribution
- assignment provenance
- assignment legitimacy
- assignment-authority origin
- responsibility-allocation origin
- assignment governance

The module applies wherever governance requires reconstruction of assignment origins.

Module Function

The module applies wherever systems must preserve:

- identifiable assignment sources
- traceable assignment origins
- reconstructable assignment history
- accountable assignment initiation
- governance-valid assignment attribution
- operationally valid assignment provenance

Its function is to ensure that governance can determine who initiated responsibility assignments and under what governance conditions.

Minimum Implementation Framework

1. Define the Assignment Origin Object

The organization must define which assignment environments require origin governance.

This may include:

- organizational structures
- management systems
- contractor environments
- regulatory environments
- operational task assignment systems
- AI orchestration systems
- Human-AI operational environments
- governance frameworks

2. Define Assignment Origin Conditions

The system must define the conditions under which assignment origin remains valid.

This includes:

- assignment-source requirements
- authority requirements
- attribution requirements
- legitimacy requirements
- governance requirements
- assignment-origin conditions

3. Define Origin Degradation Detection Logic

The system must define how assignment-origin failures are identified.

This may include:

- unidentified assignment sources
- undocumented assignments
- assignments without authority
- illegitimate assignment relationships
- governance-blind assignment creation
- unverifiable assignment origins

4. Define Operational Response or Governance Logic

The system must define governance logic for assignment-origin failures.

Governance response may include:

- assignment review
- source verification
- governance intervention
- assignment reconstruction
- corrective actions
- assignment reassessment
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- assignment sources
- assignment events
- governance reviews
- validation activities

- intervention procedures
- resulting assignment states

A responsibility-assignment environment must not remain origin-valid if materially significant assignment relationships cannot be attributed, reconstructed, reviewed, validated, or governed.

Use Case 1 — Organizational Assignment

Environment

Scenario

A governance investigation seeks to determine who assigned a critical operational responsibility that later contributed to a significant outcome.

Application

RAOIM reconstructs the origin of the assignment and identifies the actor or governance structure responsible for initiating it.

Result

Governance gains visibility into the source and legitimacy of responsibility assignments.

Use Case 2 — Human-AI Assignment

Environment

Scenario

An orchestration system assigns operational responsibilities across AI agents and human supervisors.

Application

RAOIM reconstructs where assignments originated and identifies the governance authority responsible for creating them.

Result

Governance gains visibility into assignment origins across intelligent operational ecosystems.

Canonical Closing Statement

Responsibility Assignment Origin Integrity Module (RAOIM) defines the structural conditions under which responsibility assignments remain attributable to identifiable, legitimate, traceable,

governable, reconstructable, accountable, and operationally valid
assignment sources throughout the
responsibility-assignment lifecycle.

**Responsibility assignment cannot be governed if the source of
assignment cannot be identified. Responsibility Assignment Origin
Integrity therefore becomes a foundational condition of trustworthy
responsibility- assignment governance.**
