

RASIM — Responsibility Assignment Scope Integrity Module

OriginID: OOF-OID-AGA-RASIM-2026-06-17-0057Architecture **Ecosystem:** Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Responsibility Assignment Governance Layer

Governed Space: Responsibility Assignment Scope Integrity

Category: Governance & Enforcement

Subcategory: Responsibility Assignment Governance

Type: Responsibility Assignment Standard Module

Parent Standard: Responsibility Assignment Standard (RAS-A)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 17 June 2026

Compatibility: OOF Methodology OS · Responsibility Assignment Standard (RAS-A) · Responsibility Governance Standard (RGS) · Capability Readiness Governance Standard (CRGS) · Chain of Control Standard (CCS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Responsibility Assignment Scope Integrity Module (RASIM) defines the structural conditions under which assigned responsibilities, assigned duties, assigned obligations, assigned tasks, assignment boundaries, assignment limitations, assignment expectations, and assignment outcomes remain identifiable, traceable, governable, reconstructable, reviewable, and operationally valid throughout the responsibility-assignment lifecycle.

RASIM governs responsibility-assignment scope.

The module establishes the integrity conditions required to determine exactly what responsibility was assigned, what remained outside the assignment, where assignment boundaries begin, and where assignment boundaries end.

Module Operational Role

RASIM defines the assignment-scope governance layer of RAS-A.

Its role is to preserve visibility of assignment boundaries and assignment coverage.

Module Operational Space

RASIM governs:

- assignment scope
- assignment boundaries
- assigned duties
- assigned obligations
- assigned tasks
- assignment limitations
- assignment expectations
- assignment coverage

The module applies wherever governance requires clarification of responsibility-assignment boundaries.

Module Function

The module applies wherever systems must preserve:

- clearly defined assignments
- visible assignment boundaries
- reconstructable assignment domains
- accountable assignment structures
- governance-valid assignment limits
- operational assignment clarity

Its function is to ensure that governance can determine exactly what was assigned and what was not assigned.

Minimum Implementation Framework

1. Define the Assignment Scope Object

The organization must define which assignment environments require scope governance.

This may include:

- organizational structures
- project environments
- contractor networks
- supervisory systems
- operational task assignment systems
- AI orchestration systems
- Human-AI operational environments
- governance frameworks

2. Define Assignment Scope Conditions

The system must define the conditions under which assignment scope remains valid.

This includes:

- assignment-boundary requirements
- coverage requirements
- obligation requirements
- task-definition requirements
- governance requirements
- scope-valid assignment conditions

3. Define Scope Degradation Detection Logic

The system must define how assignment-scope failures are identified.

This may include:

- undefined assignments
- assignment ambiguity
- overlapping assignments
- assignment gaps
- governance-blind task allocation
- unclear assignment boundaries

4. Define Operational Response or Governance Logic

The system must define governance logic for assignment-scope failures.

Governance response may include:

- assignment review
- scope verification
- governance intervention
- assignment clarification
- corrective actions
- assignment reassessment
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- assignment definitions
- assignment boundaries
- governance reviews
- validation activities
- intervention procedures
- resulting assignment states

A responsibility-assignment environment must not remain scope-valid if materially significant assignment boundaries cannot be reconstructed, reviewed, validated, clarified, or governed.

Use Case 1 — Contractor Assignment

Environment

Scenario

A project involves multiple contractors, supervisors, and operational personnel working across interconnected responsibilities.

Application

RASIM determines exactly which duties were assigned to each actor and identifies assignment boundaries.

Result

Governance gains visibility into assignment coverage and assignment limitations.

Use Case 2 — Human-AI Assignment

Environment

Scenario

An orchestration platform distributes operational responsibilities among AI agents, supervisors, operators, and governance actors.

Application

RASIM determines exactly which obligations and tasks were assigned to each participant.

Result

Governance gains visibility into assignment boundaries across intelligent operational ecosystems.

Canonical Closing Statement

Responsibility Assignment Scope Integrity Module (RASIM) defines the structural conditions under which assigned responsibilities, assigned duties, assigned obligations, assigned tasks, assignment boundaries, assignment limitations, assignment expectations, and assignment outcomes remain identifiable, traceable, governable, reconstructable, reviewable, and operationally valid throughout

the responsibility-assignment lifecycle.

A responsibility assignment cannot be enforced if the scope of the assignment is unclear. Responsibility Assignment Scope Integrity therefore becomes a foundational condition of trustworthy responsibility- assignment governance.
