

RATIM — Responsibility Assignment Traceability Integrity Module

OriginID: OOF-OID-AGA-RATIM-2026-06-17-0059Architecture **Ecosystem:**

Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Responsibility Assignment Governance Layer

Governed Space: Responsibility Assignment Traceability Integrity

Category: Governance & Enforcement

Subcategory: Responsibility Assignment Governance

Type: Responsibility Assignment Standard Module

Parent Standard: Responsibility Assignment Standard (RAS-A)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 17 June 2026

Compatibility: OOF Methodology OS · Responsibility Assignment

Standard (RAS-A) · Responsibility Traceability

Standard (RTS) · Evidence Accountability Standard (EAS) · Chain of

Control Standard (CCS) · INTEGROS® — Integrity

Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Responsibility Assignment Traceability Integrity Module (RATIM)

defines the structural conditions under which responsibility assignments, assignment transfers, assignment acceptances, assignment validations, assignment reviews, assignment modifications, assignment records, and assignment outcomes remain traceable, reconstructable, reviewable, auditable, governable, enforceable, and operationally valid throughout the responsibility-assignment lifecycle.

RATIM governs responsibility-assignment traceability.

The module establishes the integrity conditions required to determine how responsibility assignments evolved, who modified assignments, who accepted assignments, how assignments changed over time, and whether the complete assignment history can be reconstructed.

Module Operational Role

RATIM defines the assignment-traceability governance layer of RAS-A.

Its role is to preserve visibility and reconstructability of

responsibility assignments throughout governance environments.

Module Operational Space

RATIM governs:

- assignment traceability
- assignment reconstruction
- assignment auditability
- assignment-history governance
- assignment-transfer traceability
- assignment-record traceability
- assignment lifecycle traceability
- governance traceability

The module applies wherever governance requires reconstruction of responsibility-assignment history.

Module Function

The module applies wherever systems must preserve:

- traceable responsibility assignments
- reconstructable assignment history
- auditable assignment decisions
- accountable assignment transfers
- governance-valid assignment records
- operational assignment transparency

Its function is to ensure that governance can reconstruct how responsibility was assigned, modified, transferred, accepted, reviewed, and governed throughout its lifecycle.

Minimum Implementation Framework

1. Define the Assignment Traceability Object

The organization must define which assignment environments require traceability governance.

This may include:

- organizational structures
- project environments
- contractor networks
- management systems
- operational task-assignment systems
- AI governance systems
- Human-AI operational environments
- governance frameworks

2. Define Assignment Traceability Conditions

The system must define the conditions under which responsibility-assignment traceability remains valid.

This includes:

- traceability requirements
- reconstruction requirements
- auditability requirements
- assignment-history requirements
- governance requirements
- traceability-valid assignment conditions

3. Define Traceability Degradation Detection Logic

The system must define how assignment-traceability failures are identified.

This may include:

- missing assignment records
- undocumented assignment transfers
- incomplete assignment history
- assignment gaps
- governance-blind assignment activities
- unreconstructable assignment chains

4. Define Operational Response or Governance Logic

The system must define governance logic for assignment-traceability failures.

Governance response may include:

- assignment review
- audit procedures
- governance intervention
- assignment reconstruction
- corrective actions
- traceability verification
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- assignment creation
- assignment transfers

- assignment acceptances
- governance reviews
- validation activities
- resulting assignment states

A responsibility-assignment environment must not remain traceability-valid if materially significant assignment activities cannot be reconstructed, reviewed, audited, validated, enforced, or governed.

Use Case 1 — Multi-Layer Contractor

Environment

Scenario

A responsibility passes through supervisors, contractors, subcontractors, temporary workers, and operational teams before execution occurs.

Application

RATIM reconstructs assignment transfers, assignment acceptances, assignment modifications, and assignment-history continuity.

Result

Governance gains visibility into the complete responsibility-assignment pathway.

Use Case 2 — Human-AI Assignment

Environment

Scenario

Operational responsibilities are dynamically allocated among AI agents, orchestration systems, operators, and supervisors.

Application

RATIM reconstructs assignment pathways, governance decisions, assignment transfers, and assignment-history evolution.

Result

Governance gains visibility into assignment traceability across intelligent operational ecosystems.

Canonical Closing Statement

Responsibility Assignment Traceability Integrity Module (RATIM)

defines the structural conditions under which responsibility assignments, assignment transfers, assignment acceptances, assignment validations, assignment reviews, assignment modifications, assignment records, and assignment outcomes remain traceable, reconstructable, reviewable, auditable, governable, enforceable, and operationally valid throughout the responsibility-assignment lifecycle.

Responsibility assignment that cannot be reconstructed cannot be governed. Responsibility Assignment Traceability Integrity therefore becomes a foundational condition of trustworthy responsibility-assignment governance.
