

RAVIM — Responsibility Assignment Validity Integrity Module

OriginID: OOF-OID-AGA-RAVIM-2026-06-17-0058Architecture **Ecosystem:**

Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Responsibility Assignment Governance Layer

Governed Space: Responsibility Assignment Validity Integrity

Category: Governance & Enforcement

Subcategory: Responsibility Assignment Governance

Type: Responsibility Assignment Standard Module

Parent Standard: Responsibility Assignment Standard (RAS-A)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 17 June 2026

Compatibility: OOF Methodology OS · Responsibility Assignment

Standard (RAS-A) · Responsibility Governance

Standard (RGS) · Authority Governance Standard (AGS) · Capability

Readiness Governance Standard (CRGS) ·

INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Responsibility Assignment Validity Integrity Module (RAVIM) defines

the structural conditions under which responsibility assignments remain legitimate, authorized, accepted, recognized, governable, reconstructable, reviewable, enforceable, and operationally valid throughout the responsibility-assignment lifecycle.

RAVIM governs responsibility-assignment validity.

The module establishes the integrity conditions required to determine whether a responsibility assignment was made by an authorized actor, accepted by the assigned actor, recognized by the governance environment, and suitable for

operational execution.

Module Operational Role

RAVIM defines the assignment-validity governance layer of RAS-A.

Its role is to ensure that responsibility assignments remain legitimate and governance-valid throughout their lifecycle.

Module Operational Space

RAVIM governs:

- assignment validity
- assignment legitimacy
- assignment authorization
- assignment acceptance
- assignment recognition
- assignment enforceability
- governance-valid assignment
- assignment lifecycle governance

The module applies wherever governance requires confirmation that responsibility assignments remain valid.

Module Function

The module applies wherever systems must preserve:

- legitimate responsibility assignments
- authorized assignment relationships
- accepted assignments
- recognized assignment structures
- governance-valid assignment states
- operationally enforceable assignments

Its function is to ensure that governance can determine whether responsibility assignments remain valid before responsibility is executed, reviewed, traced, or connected to accountability.

Minimum Implementation Framework

1. Define the Assignment Validity Object

The organization must define which assignment environments require validity governance.

This may include:

- organizational structures
- management systems
- contractor networks
- certification environments
- regulatory systems
- AI governance systems
- Human-AI operational environments
- governance frameworks

2. Define Assignment Validity Conditions

The system must define the conditions under which responsibility assignments remain valid.

This includes:

- authorization requirements
- acceptance requirements
- legitimacy requirements
- recognition requirements
- governance requirements
- assignment-valid conditions

3. Define Validity Degradation Detection Logic

The system must define how assignment-validity failures are identified.

This may include:

- assignment without authority
- assignment without acceptance
- illegitimate assignment relationships
- invalid assignment structures
- governance-invalid assignments
- unenforceable assignments

4. Define Operational Response or Governance Logic

The system must define governance logic for assignment-validity failures.

Governance response may include:

- assignment review
- authorization verification
- governance intervention
- assignment reassessment
- corrective actions
- assignment validation
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- assignment authorizations
- assignment acceptances
- governance reviews
- validation activities

- intervention procedures
- resulting assignment states

A responsibility-assignment environment must not remain validity-valid if materially significant assignment relationships cannot be reconstructed, reviewed, validated, recognized, accepted, authorized, or governed.

Use Case 1 — Operational Assignment

Environment

Scenario

A supervisor assigns a critical responsibility to an operational worker during a complex project involving safety, quality, and compliance obligations.

Application

RAVIM evaluates whether the supervisor possessed assignment authority, whether the assignment was accepted, and whether the assignment remained operationally valid.

Result

Governance gains visibility into the legitimacy and validity of responsibility assignments.

Use Case 2 — Human-AI Assignment

Environment

Scenario

An orchestration platform allocates operational responsibilities across AI agents and human supervisors.

Application

RAVIM evaluates whether assignment authority, assignment acceptance, governance authorization, and operational validity remain preserved.

Result

Governance gains visibility into the validity of responsibility assignments across intelligent operational ecosystems.

Canonical Closing Statement

Responsibility Assignment Validity Integrity Module (RAVIM) defines the structural conditions under which responsibility assignments remain legitimate, authorized, accepted, recognized, governable, reconstructable, reviewable, enforceable, and operationally valid throughout the responsibility-assignment lifecycle.

Responsibility may be assigned, but assignments that lack legitimacy, authority, or acceptance cannot be trusted. Responsibility Assignment Validity Integrity therefore becomes a foundational condition of trustworthy responsibility-assignment governance.
