

RCIM — Relationship Classification Integrity Module

OriginID: OOF-OID-AGA-RCIM-2026-06-14-0002

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Relationship Governance Layer

Category: Governance & Enforcement

Subcategory: Accountability Governance Architecture

Type: Relationship Accountability Standard Module

Parent Standard: Relationship Accountability Standard (RAS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 14 June 2026

Compatibility: Accountability Governance Architecture (AGA™) ·

Relationship Accountability Standard (RAS) · Authority

Governance Standard (AGS) · Responsibility Governance Standard (RGS)

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Relationship Classification Integrity Module (RCIM) defines the structural conditions under which identified relationships remain correctly classified, distinguishable, governable, traceable, and operationally valid throughout governance analysis.

RCIM governs relationship classification.

The module establishes the conditions required to determine what type of relationship exists between actors before authority, responsibility, capability, control, oversight, evidence, accountability, and consequence can be evaluated.

Module Operational Role

RCIM serves as the classification layer of the Relationship Accountability Standard.

Its role is to ensure that identified relationships are correctly understood and categorized before governance analysis proceeds.

RCIM answers the question:

What type of relationship actually exists between the actors?

Module Operational Space

RCIM governs:

- relationship classification
- relationship categorization
- relationship differentiation
- relationship governance mapping
- relationship validation
- relationship traceability
- relationship accountability

The module applies wherever governance requires understanding the nature of relationships.

Module Function

The module ensures that governance can distinguish between:

- employment relationships
- contractor relationships
- subcontractor relationships
- agency relationships
- supervisory relationships
- delegated relationships
- collaborative relationships
- organizational relationships
- Human-AI relationships
- AI-agent relationships
- orchestration relationships

Its function is to prevent governance errors caused by relationship misclassification.

Minimum Implementation Framework

1. Define Classification Scope

Determine which relationship categories are relevant to the operational environment.

Examples:

- employment
- contractual
- supervisory
- delegated
- autonomous
- collaborative

2. Analyze Relationship Characteristics

Identify the characteristics of each relationship.

Examples:

- reporting structure
- operational control
- contractual obligations
- authority structure
- supervision structure
- execution role

3. Assign Relationship Classification

Assign each identified relationship to the most accurate governance category.

Governance must distinguish:

- direct relationships
- indirect relationships
- formal relationships
- operational relationships
- hybrid relationships

4. Validate Classification Accuracy

Determine whether the assigned classification reflects operational reality.

Governance must identify:

- misclassified relationships
- hidden relationships
- disguised relationships
- undocumented relationships

5. Preserve Classification Traceability

Maintain sufficient evidence to reconstruct relationship classifications throughout governance analysis.

Use Case 1 — Agency Worker Environment

Scenario

A worker is formally employed by an agency but performs work under the daily direction of a manufacturing company.

Application

RCIM classifies the operational relationship structure rather than relying solely on contractual labels.

Result

Governance gains a more accurate understanding of operational reality.

Use Case 2 — Multi-Agent Orchestration Environment

Scenario

Several AI agents operate under a central orchestration layer while interacting with external tools and human supervisors.

Application

RCIM classifies the governance relationships between participating actors and systems.

Result

Governance gains a structured understanding of authority, supervision, and operational interaction pathways.

Canonical Closing Statement

Relationship Classification Integrity Module (RCIM) defines the structural conditions under which identified relationships remain correctly classified, distinguishable, governable, traceable, and operationally valid throughout governance analysis.

Governance cannot accurately evaluate a relationship that has been incorrectly classified. Relationship classification therefore becomes a foundational condition of accountability governance
