

Relationship Accountability Standard - (RAS)

OriginID: OOF-OID-AGA-RAS-2026-06-14-0001

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Relationship Governance Layer

Governed Space: Relationship Accountability

Category: Governance & Accountability

Subcategory: Relationship Governance Architecture

Type: Foundational Parent Standard

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 14 June 2026

Compatibility: OOF Methodology OS · Accountability Governance

Architecture (AGA™) · Authority Governance

Standard (AGS) · Responsibility Governance Standard (RGS) · Chain of

Control Standard (CCS) · Governance Oversight

Standard (GOS)

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Preview

Relationship Accountability Standard (RAS) defines the structural conditions under which operational relationships remain identifiable, classifiable, traceable, accountable, and governable throughout their lifecycle.

RAS governs the relationship layer of accountability. It establishes the foundation required to determine authority, responsibility, control, oversight, evidence, and accountability across organizations, institutions, AI systems, autonomous agents, contractor networks, and multi-layer operational environments.

→ **Every accountability chain begins with a relationship.**

About Standard

Canonical Definition

Relationship Accountability Standard (RAS) defines the structural conditions under which operational, contractual, organizational, supervisory, delegated, collaborative, autonomous, Human-AI, and multi-party relationships remain identifiable, classifiable, traceable, accountable, governable, and operationally valid throughout their lifecycle.

RAS governs relationships.

The standard establishes the conditions required to determine the actual operational relationship between actors before authority, responsibility, control, oversight, evidence, accountability, and consequence can be evaluated.

What This Standard Is

RAS is the foundational parent standard of AGA™.

It governs:

- relationship identification
- relationship classification
- relationship boundaries
- relationship continuity
- relationship traceability
- relationship accountability

RAS answers the first governance question:

What is the actual operational relationship between the actors?

What This Standard Is Not

RAS is not:

- an authority standard
- a responsibility standard
- a control standard
- an oversight standard
- an accountability standard

RAS governs the relationship itself.

The remaining governance layers are evaluated only after the relationship is identified.

Why This Standard Exists

Most governance failures begin with relationship misunderstanding.

Organizations frequently attempt to determine:

- responsibility
 - authority
 - accountability
 - liability
-

- compliance

before determining the true operational relationship.

This creates governance blindness.

A governance chain cannot be reliably reconstructed if the underlying relationship remains unknown.

RAS exists to solve that problem.

Core Insight

Before asking who was responsible, governance must first determine who was related to whom and how.

Operational Architecture Space

RAS defines the operational architecture space for:

- relationship governance
- relationship identification
- relationship classification
- relationship continuity
- relationship traceability
- relationship accountability

The space exists because every governance structure begins with a relationship.

Without a relationship there can be no authority, responsibility, control, oversight, evidence chain, or accountability chain.

Architectural Position

Within AGA™, RAS serves as the first governance layer.

The architecture flow begins:

Relationship → Authority → Responsibility → Capability → Control → Oversight → Evidence → Accountability → Consequence

RAS governs the first step.

Foundational Principle

No authority exists without a relationship. No responsibility exists without a relationship. No accountability exists without

a relationship.

Canonical Closing Statement

Relationship Accountability Standard (RAS) defines the structural conditions under which operational, contractual, organizational, supervisory, delegated, collaborative, autonomous, Human-AI, and multi-party relationships remain identifiable, classifiable, traceable, accountable, governable, and operationally valid throughout their lifecycle.

Every governance chain begins with a relationship. If the relationship is misunderstood, every subsequent governance conclusion may become invalid.
