

RCAIM — Responsibility Continuity Accountability Integrity Module

OriginID: OOF-OID-AGA-RCAIM-2026-06-17-0065Architecture **Ecosystem:**

Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Responsibility Continuity Governance Layer

Governed Space: Responsibility Continuity Accountability Integrity

Category: Governance & Enforcement

Subcategory: Responsibility Continuity Governance

Type: Responsibility Continuity Standard Module

Parent Standard: Responsibility Continuity Standard (RCS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 17 June 2026

Compatibility: OOF Methodology OS · Responsibility Continuity

Standard (RCS) · Accountability Governance Standard

(AGS-A) · Responsibility Governance Standard (RGS) · Evidence

Accountability Standard (EAS) · INTEGROS® —

Integrity Standard

AI-Readable: Yes

Authority: OOF

Canonical Language: English (UCL)

Canonical Definition

Responsibility Continuity Accountability Integrity Module (RCAIM)

defines the structural conditions under which responsibility-preservation relationships, continuity decisions, responsibility transfers, continuity approvals, continuity validations, continuity outcomes, and continuity-governance activities remain attributable, accountable, traceable, governable, reconstructable, enforceable, and operationally valid throughout the responsibility lifecycle.

RCAIM governs responsibility-continuity accountability.

The module establishes the integrity conditions required to determine who remained accountable for preserving responsibility continuity, who approved continuity transitions, who governed responsibility transfers, and who remains accountable when responsibility continuity failures occur.

Module Operational Role

RCAIM defines the continuity-accountability governance layer of RCS.

Its role is to ensure that responsibility continuity remains connected to accountable governance actors throughout the

Module Operational Space

RCAIM governs:

- continuity accountability
- continuity ownership
- continuity-decision accountability
- continuity-transfer accountability
- continuity-failure accountability
- governance accountability
- responsibility-preservation accountability
- consequence attribution preparation

The module applies wherever governance must determine accountability arising from responsibility continuity.

Module Function

The module applies wherever systems must preserve:

- accountable continuity structures
- attributable continuity decisions
- reconstructable accountability history
- traceable continuity outcomes
- governance-valid accountability relationships
- operational continuity enforcement

Its function is to ensure that governance can determine who remains accountable for preserving responsibility continuity and continuity-related outcomes.

Minimum Implementation Framework

1. Define the Continuity Accountability Object

The organization must define which continuity environments require accountability governance.

This may include:

- organizational structures
- contractor networks
- project environments
- management systems
- compliance environments
- AI governance systems
- Human-AI operational environments
- governance frameworks

2. Define Continuity Accountability Conditions

The system must define the conditions under which continuity accountability remains valid.

This includes:

- attribution requirements
- accountability requirements
- enforcement requirements
- consequence requirements
- governance requirements
- accountability-valid continuity conditions

3. Define Accountability Degradation Detection Logic

The system must define how continuity-accountability failures are identified.

This may include:

- anonymous continuity decisions
- undocumented continuity approvals
- accountability gaps
- continuity ownership ambiguity
- governance-blind continuity activities
- unverifiable continuity accountability

4. Define Operational Response or Governance Logic

The system must define governance logic for continuity-accountability failures.

Governance response may include:

- accountability review
- attribution verification
- governance intervention
- corrective actions
- continuity reassessment
- enforcement procedures
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- continuity decisions
- continuity approvals

- responsibility transfers
- governance reviews
- accountability relationships
- resulting continuity outcomes

A responsibility-continuity environment must not remain accountability-valid if materially significant continuity activities cannot be attributed, reconstructed, reviewed, enforced, validated, preserved, or governed.

Use Case 1 — Contractor Responsibility

Handover Failure

Scenario

Responsibility passes through multiple organizations before an operational failure occurs. The investigation must determine who was accountable for preserving responsibility continuity.

Application

RCAIM reconstructs continuity decisions, responsibility transfers, approvals, and governance actions throughout the continuity chain.

Result

Governance gains visibility into accountability for responsibility-continuity failures.

Use Case 2 — Human-AI Operational

Environment

Scenario

Responsibilities transition between human supervisors, orchestration systems, and AI agents during operational execution.

Application

RCAIM reconstructs continuity ownership, continuity approvals, governance responsibilities, and accountability relationships.

Result

Governance gains visibility into accountability for continuity decisions across intelligent operational ecosystems.

Canonical Closing Statement

Responsibility Continuity Accountability Integrity Module (RCAIM)

defines the structural conditions under which responsibility-preservation relationships, continuity decisions, responsibility transfers, continuity approvals, continuity validations, continuity outcomes, and continuity-governance activities remain attributable, accountable, traceable, governable, reconstructable, enforceable, and operationally valid throughout the responsibility lifecycle.

Responsibility continuity without accountability creates governance blind spots. Responsibility Continuity Accountability Integrity therefore becomes a foundational condition of trustworthy responsibility continuity governance and trustworthy accountability attribution.
