

RCOIM — Responsibility Continuity Origin Integrity Module

OriginID: OOF-OID-AGA-RCOIM-2026-06-17-0061Architecture **Ecosystem:**

Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Responsibility Continuity Governance Layer

Governed Space: Responsibility Continuity Origin Integrity

Category: Governance & Enforcement

Subcategory: Responsibility Continuity Governance

Type: Responsibility Continuity Standard Module

Parent Standard: Responsibility Continuity Standard (RCS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 17 June 2026

Compatibility: OOF Methodology OS · Responsibility Continuity

Standard (RCS) · Responsibility Governance Standard

(RGS) · Responsibility Assignment Standard (RAS-A) · Accountability

Governance Standard (AGS-A) · INTEGROS® —

Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Responsibility Continuity Origin Integrity Module (RCOIM) defines

the structural conditions under which responsibility-continuity relationships remain attributable to identifiable, legitimate, traceable, governable, reconstructable, accountable, and operationally valid responsibility sources throughout the responsibility lifecycle.

RCOIM governs responsibility-continuity origin.

The module establishes the integrity conditions required to determine where responsibility continuity originated, which responsibility relationship is being preserved, and whether the continuity relationship remains connected to a legitimate responsibility source.

Module Operational Role

RCOIM defines the continuity-origin governance layer of RCS.

Its role is to preserve visibility into the original responsibility relationship from which continuity emerges.

Module Operational Space

RCOIM governs:

- continuity origin
- responsibility-source continuity
- continuity attribution
- continuity provenance
- preserved responsibility origin
- continuity legitimacy
- responsibility-preservation origin
- continuity governance

The module applies wherever governance requires reconstruction of continuity origins.

Module Function

The module applies wherever systems must preserve:

- identifiable continuity sources
- traceable continuity origins
- reconstructable continuity history
- accountable continuity relationships
- governance-valid continuity attribution
- operationally valid continuity provenance

Its function is to ensure that governance can determine which original responsibility relationship remains preserved throughout operational reality.

Minimum Implementation Framework

1. Define the Continuity Origin Object

The organization must define which continuity environments require origin governance.

This may include:

- organizational structures
- management systems
- contractor environments
- subcontractor chains
- project environments
- AI governance systems
- Human-AI operational environments
- governance frameworks

2. Define Continuity Origin Conditions

The system must define the conditions under which continuity origin remains valid.

This includes:

- continuity-source requirements
- attribution requirements
- legitimacy requirements
- preservation requirements
- governance requirements
- continuity-origin conditions

3. Define Origin Degradation Detection Logic

The system must define how continuity-origin failures are identified.

This may include:

- unidentified responsibility origins
- undocumented continuity relationships
- illegitimate continuity structures
- governance-blind responsibility preservation
- continuity-source ambiguity
- unverifiable continuity origins

4. Define Operational Response or Governance Logic

The system must define governance logic for continuity-origin failures.

Governance response may include:

- continuity review
- source verification
- governance intervention
- continuity reconstruction
- corrective actions
- continuity reassessment
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- responsibility origins
- continuity relationships
- governance reviews
- validation activities

- intervention procedures
- resulting continuity states

A responsibility-continuity environment must not remain origin-valid if materially significant continuity relationships cannot be attributed, reconstructed, reviewed, validated, or governed.

Use Case 1 — Contractor Handover Environment

Scenario

Responsibility passes through multiple contractors and supervisors before an operational outcome occurs.

Application

RCOIM reconstructs the original responsibility relationship and verifies whether continuity remained connected to that origin.

Result

Governance gains visibility into the source and legitimacy of responsibility continuity.

Use Case 2 — Human-AI Operational Environment

Scenario

Responsibilities move between human supervisors, orchestration systems, and autonomous agents throughout execution.

Application

RCOIM reconstructs the original responsibility relationship and verifies continuity preservation across intelligent operational environments.

Result

Governance gains visibility into continuity origins across Human-AI ecosystems.

Canonical Closing Statement

Responsibility Continuity Origin Integrity Module (RCOIM) defines the structural conditions under which responsibility-continuity relationships remain attributable to identifiable, legitimate, traceable, governable, reconstructable, accountable, and operationally valid responsibility sources throughout the responsibility lifecycle.

Responsibility continuity cannot be preserved if the original responsibility relationship cannot be identified. Responsibility Continuity Origin Integrity therefore becomes a foundational condition of trustworthy responsibility continuity governance.
