

AGA™ Architecture Index

Accountability Governance Architecture

Official Accountability Governance Map for Organizations, Institutions, Governments, Autonomous Systems and Human-AI Operational Environments AGA™ (Accountability Governance Architecture) serves as the official OOF® accountability governance map used for accountability space identification, accountability governance classification, accountability diagnostics, accountability validation, accountability architecture analysis, and accountability problem placement across organizational, institutional, technological, autonomous, and Human-AI environments. AGA™ provides the primary accountability governance reference architecture used to identify where accountability-related problems belong before accountability analysis, accountability investigation, accountability validation, accountability governance, or accountability improvement begins. The purpose of AGA™ is not to investigate accountability. The purpose of AGA™ is to identify and define the governable accountability spaces of operational reality.

- **AGA™ serves as an official accountability governance reference map for:**
- **Organizations**
- **Institutions**
- **Governments**
- **Regulatory Authorities**
- **Contractor Networks**
- **Supply Chains**
- **Corporate Groups**
- **Human-AI Environments**
- **Autonomous Agents**
- **Multi-Agent Systems**
- **Robotics**
- **Intelligent Infrastructure**
- **Future Autonomous Systems**

Core Architectural Principle

Every accountability space answers one primary question. No accountability space duplicates the purpose of another accountability space. Every accountability space begins where the previous accountability space ends. Together these accountability spaces form the official accountability governance map of AGA™.

1. Relationship Accountability Standard (RAS)

Core Question

What is the actual relationship between the actors?

Canonical Definition

RAS defines the conditions under which operational relationships remain identifiable, reconstructable, governable, accountable, and operationally valid.

Governance Boundary

Begins when two or more actors enter an operational relationship.
Ends when authority relationships can be evaluated.

2. Authority Governance Standard (AGS)

Core Question

Who has the authority to act?

Canonical Definition

AGS defines the conditions under which authority remains identifiable, legitimate, governable, accountable, and operationally valid.

Governance Boundary

Begins when authority exists. Ends when authority validity can be evaluated.

3. Authority Validation Standard (AVS)

Core Question

Is the authority valid?

Canonical Definition

AVS defines the conditions under which authority remains legitimate, recognized, enforceable, and governance-valid.

Governance Boundary

Begins when authority requires validation. Ends when authority validity has been determined.

4. Authority Delegation Standard (ADS)

Core Question

Has authority been delegated?

Canonical Definition

ADS defines the conditions under which authority may be transferred, delegated, accepted, preserved, and governed.

Governance Boundary

Begins when authority moves between actors. Ends when delegated authority becomes operational.

5. Authority Escalation Standard (AES)

Core Question

Should authority have been escalated?

Canonical Definition

AES defines the conditions under which authority escalation becomes required, justified, governable, and operationally valid.

Governance Boundary

Begins when authority exceeds operational limits. Ends when escalation obligations can be evaluated.

6. Responsibility Governance Standard (RGS)

Core Question

Who had the obligation to act?

Canonical Definition

RGS defines the conditions under which responsibility ownership, responsibility obligations, and responsibility governance remain identifiable and enforceable.

Governance Boundary

Begins when responsibility exists. Ends when responsibility assignment can be evaluated.

7. Responsibility Assignment Standard (RAS-A)

Core Question

To whom was responsibility assigned?

Canonical Definition

RAS-A defines the conditions under which responsibility assignment, acceptance, ownership, and transfer remain governable and accountable.

Governance Boundary

Begins when responsibility is assigned. Ends when responsibility ownership can be evaluated.

8. Responsibility Continuity Standard (RCS)

Core Question

Did responsibility remain preserved?

Canonical Definition

RCS defines the conditions under which responsibility remains preserved throughout operational and governance transitions.

Governance Boundary

Begins when responsibility changes over time. Ends when responsibility continuity can be evaluated.

9. Responsibility Traceability Standard (RTS)

Core Question

Can responsibility be reconstructed?

Canonical Definition

RTS defines the conditions under which responsibility history remains traceable, reconstructable, reviewable, and governable.

Governance Boundary

Begins when responsibility history exists. Ends when responsibility reconstruction becomes possible.

10. Capability Readiness Governance Standard (CRGS)

Core Question

Was the actor capable of acting?

Canonical Definition

CRGS defines the conditions under which capability, competence,

qualifications, resources, readiness, and operational preparedness remain governable.

Governance Boundary

Begins when an actor is expected to perform. Ends when capability readiness can be evaluated.

11. Chain of Control Standard (CCS)

Core Question

Who actually controlled the outcome?

Canonical Definition

CCS defines the conditions under which operational control remains identifiable, reconstructable, governable, and accountable.

Governance Boundary

Begins when operational influence exists. Ends when actual control can be determined.

12. Governance Oversight Standard (GOS)

Core Question

Who should have supervised?

Canonical Definition

GOS defines the conditions under which oversight obligations, supervision structures, and governance review responsibilities remain identifiable and enforceable.

Governance Boundary

Begins when oversight obligations exist. Ends when oversight performance can be evaluated.

13. Evidence Accountability Standard (EAS)

Core Question

What do the facts prove?

Canonical Definition

EAS defines the conditions under which evidence remains valid, reconstructable, reviewable, accountable, and governance-relevant.

Governance Boundary

Begins when evidence exists. Ends when evidentiary conclusions can be established.

14. Accountability Governance Standard (AGS-A)

Core Question

Who remains answerable?

Canonical Definition

AGS-A defines the conditions under which accountability relationships remain identifiable, attributable, governable, and enforceable.

Governance Boundary

Begins when accountability exists. Ends when accountability ownership can be evaluated.

15. Decision Accountability Standard (DAS)

Core Question

Who made the decision?

Canonical Definition

DAS defines the conditions under which decisions remain attributable to accountable decision-makers, decision authorities, and governance structures.

Governance Boundary

Begins when decisions are made. Ends when decision accountability can be evaluated.

16. Accountability Continuity Standard (ACS)

Core Question

Did accountability remain preserved?

Canonical Definition

ACS defines the conditions under which accountability remains preserved throughout governance, operational, technological, contractual, and organizational change.

Governance Boundary

Begins when accountability persists through time. Ends when

17. Accountability Chain Standard (ACS-C)

Core Question

How does accountability travel across governance structures?

Canonical Definition

ACS-C defines the conditions under which accountability relationships remain connected, traceable, reconstructable, and governable across multi-layer governance structures.

Governance Boundary

Begins when accountability spans multiple governance layers. Ends when accountability-chain reconstruction becomes possible.

Architectural Position

AGA™ governs the complete accountability lifecycle. The architecture progresses:

- **Relationship → Authority → Responsibility → Capability → Control → Oversight → Evidence → Accountability →**
- **Decision Accountability → Accountability Continuity → Accountability Chain**

Together these accountability spaces govern how accountability remains identifiable, attributable, reconstructable, enforceable, and governable throughout operational reality.

What AGA™ Defines

AGA™ defines: where accountability begins, where authority operates, where responsibility exists, where capability becomes relevant, where control is exercised, where oversight applies, where evidence becomes relevant, where accountability emerges, where decisions become accountable, where accountability remains preserved, where accountability chains operate. AGA™ provides the official accountability governance language used for accountability space identification across organizational, institutional, autonomous, and intelligent systems.

Canonical Principle

AGA™ does not govern what a system does. AGA™ governs how accountability itself remains identifiable, attributable, reconstructable, enforceable, and governable throughout

operational reality.

Canonical Closing Statement

AGA™ serves as the official OOF® accountability governance map for organizations, institutions, governments, autonomous systems, and Human-AI operational environments. By defining the primary governable accountability spaces of operational reality, AGA™ provides a structured accountability reference architecture used to identify, classify, govern, validate, investigate, and understand accountability throughout the complete accountability lifecycle.
