

RAIM — Responsibility Accountability Integrity Module

OriginID: OOF-OID-AGA-RAIM-2026-06-14-0030

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Responsibility Governance Layer

Governed Space: Responsibility Accountability Integrity

Category: Governance & Enforcement

Subcategory: Responsibility Governance

Type: Responsibility Governance Standard Module

Parent Standard: Responsibility Governance Standard (RGS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 14 June 2026

Compatibility: OOF Methodology OS · Responsibility Governance

Standard (RGS) · Accountability Governance

Standard (AGS-A) · Evidence Accountability Standard (EAS) ·

Authority Governance Standard (AGS) · INTEGROS® —
Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Responsibility Accountability Integrity Module (RAIM) defines the structural conditions under which responsibility assignments remain connected to identifiable accountability relationships, consequence structures, governance obligations, enforcement mechanisms, traceability requirements, and operationally valid accountability outcomes throughout the responsibility lifecycle.

RAIM governs responsibility accountability.

The module establishes the integrity conditions required to determine who remains accountable for responsibility fulfillment, responsibility failure, responsibility neglect, responsibility violation, and responsibility-related operational consequences.

Module Operational Role

RAIM defines the responsibility-accountability governance layer of RGS.

Its role is to ensure that responsibility remains connected to accountability throughout governance environments.

Module Operational Space

RAIM governs:

- responsibility accountability
- responsibility consequence attribution
- responsibility enforcement
- responsibility-failure accountability
- responsibility ownership accountability
- governance consequence linkage
- accountability reconstruction
- accountable responsibility governance

The module applies wherever governance must determine accountability arising from responsibility.

Module Function

The module applies wherever systems must preserve:

- accountable responsibility structures
- attributable responsibility outcomes
- reconstructable accountability history
- traceable consequence attribution
- governance-valid accountability relationships
- operational responsibility enforcement

Its function is to ensure that governance can determine who remains accountable when responsibilities are fulfilled, neglected, violated, transferred, or abandoned.

Minimum Implementation Framework

1. Define the Responsibility Accountability Object

The organization must define which responsibility environments require accountability governance.

This may include:

- management structures
- contractor chains
- subcontractor environments
- regulatory systems
- compliance environments
- quality-control systems
- AI governance systems
- Human-AI operational systems

2. Define Responsibility Accountability Conditions

The system must define the conditions under which responsibility accountability remains valid.

This includes:

- attribution requirements
- accountability requirements
- consequence requirements
- enforcement requirements
- governance requirements
- accountability-valid responsibility conditions

3. Define Accountability Degradation Detection Logic

The system must define how responsibility-accountability failures are identified.

This may include:

- accountability gaps
- responsibility abandonment
- untraceable responsibility failures
- governance-blind responsibility structures
- unenforceable responsibilities
- consequence-attribution failures

4. Define Operational Response or Governance Logic

The system must define governance logic for responsibility-accountability failures.

Governance response may include:

- accountability review
- attribution verification
- governance intervention
- enforcement procedures
- corrective actions
- consequence determination
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- responsibility assignments
- accountability relationships
- enforcement activities
- consequence determinations

- governance reviews
- resulting accountability outcomes

A responsibility-governance environment must not remain accountability-valid if materially significant responsibility activities cannot be attributed, reconstructed, reviewed, enforced, validated, or governed.

Use Case 1 — Contractor Responsibility Failure

Scenario

A quality failure occurs within a multi-layer contractor chain involving a client, contractor, subcontractor, and operational worker.

Application

RAIM reconstructs accountability relationships and determines who remains accountable for the failure and resulting consequences.

Result

Governance gains visibility into accountability across the complete responsibility structure.

Use Case 2 — Human-AI Responsibility

Environment

Scenario

An AI system fails to perform an assigned responsibility, causing operational disruption within a Human-AI environment.

Application

RAIM reconstructs accountability relationships between supervisors, orchestration systems, AI agents, and operational governance actors.

Result

Governance gains visibility into accountability for responsibility outcomes across intelligent operational systems.

Canonical Closing Statement

Responsibility Accountability Integrity Module (RAIM) defines the structural conditions under which responsibility assignments remain connected to identifiable accountability relationships, consequence structures, governance obligations, enforcement mechanisms, traceability requirements, and operationally valid accountability

outcomes throughout the responsibility lifecycle.

**Responsibility without accountability creates governance ambiguity.
Responsibility accountability integrity therefore becomes a
foundational condition of trustworthy responsibility governance and
operational consequence attribution.**
