

RVIM — Responsibility Validity Integrity Module

OriginID: OOF-OID-AGA-RVIM-2026-06-14-0028
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: Accountability Governance Architecture (AGA™)
Operational Layer: Responsibility Governance Layer
Governed Space: Responsibility Validity Integrity
Category: Governance & Enforcement
Subcategory: Responsibility Governance
Type: Responsibility Governance Standard Module
Parent Standard: Responsibility Governance Standard (RGS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 14 June 2026
Compatibility: OOF Methodology OS · Responsibility Governance Standard (RGS) · Authority Governance Standard (AGS) · Authority Validation Standard (AVS) · Authority Escalation Standard (AES) · INTEGROS® — Integrity Standard
AI-Readable: Yes
Authority: OOF
Protection: MIP — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Responsibility Validity Integrity Module (RVIM) defines the structural conditions under which responsibility assignments remain legitimate, recognized, enforceable, governable, accountable, reconstructable, and operationally valid throughout the responsibility lifecycle.

RVIM governs responsibility validity.

The module establishes the integrity conditions required to determine whether responsibility was legitimately assigned, properly accepted, operationally recognized, continuously valid, and enforceable within the governance environment.

Module Operational Role

RVIM defines the responsibility-validity governance layer of RGS.

Its role is to ensure that responsibility assignments remain legitimate and governance-valid after assignment occurs.

Module Operational Space

RVIM governs:

- responsibility validity
- responsibility legitimacy
- responsibility recognition
- responsibility acceptance
- responsibility enforceability
- responsibility lifecycle governance
- responsibility continuity
- responsibility accountability

The module applies wherever governance requires confirmation that responsibility remains valid.

Module Function

The module applies wherever systems must preserve:

- legitimate responsibility assignments
- recognized responsibility ownership
- reconstructable responsibility history
- accountable responsibility structures
- governance-valid responsibility obligations
- operationally reliable responsibility states

Its function is to ensure that governance can determine whether responsibility remained valid throughout its lifecycle.

Minimum Implementation Framework

1. Define the Responsibility Validity Object

The organization must define which responsibility environments require validity governance.

This may include:

- management structures
- contractor environments
- subcontractor networks
- regulatory systems
- operational environments
- supervisory structures
- AI governance systems
- Human-AI operational systems

2. Define Responsibility Validity Conditions

The system must define the conditions under which

responsibility remains valid.

This includes:

- legitimacy requirements
- acceptance requirements
- recognition requirements
- accountability requirements
- governance requirements
- responsibility-valid conditions

3. Define Validity Degradation Detection Logic

The system must define how responsibility-validity failures are identified.

This may include:

- invalid responsibility assignments
- expired responsibilities
- unaccepted responsibilities
- governance-invalid obligations
- responsibility conflicts
- responsibility-recognition failures

4. Define Operational Response or Governance Logic

The system must define governance logic for responsibility-validity failures.

Governance response may include:

- responsibility review
- assignment verification
- governance intervention
- reassignment procedures
- corrective actions
- responsibility validation
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- responsibility assignments
- responsibility acceptance events
- governance reviews
- validation activities
- intervention procedures
- resulting responsibility states

A responsibility-governance environment must not remain validity-valid if materially significant responsibility assignments cannot be reconstructed, reviewed, validated, recognized, or governed.

Use Case 1 — Contractor Responsibility

Environment

Scenario

A contractor assigns responsibility for quality control to a subcontractor responsible for operational execution.

Application

RVIM determines whether the responsibility assignment was legitimate, accepted, recognized, and enforceable.

Result

Governance gains visibility into the validity of responsibility ownership.

Use Case 2 — Human-AI Responsibility

Environment

Scenario

A human supervisor assigns operational responsibility to an orchestration platform responsible for coordinating AI agents.

Application

RVIM validates whether responsibility assignments remain legitimate and operationally recognized throughout execution.

Result

Governance gains visibility into responsibility validity across intelligent operational systems.

Canonical Closing Statement

Responsibility Validity Integrity Module (RVIM) defines the structural conditions under which responsibility assignments remain legitimate, recognized, enforceable, governable, accountable, reconstructable, and operationally valid throughout the responsibility lifecycle.

Responsibility may be assigned, but not every responsibility assignment is valid. Responsibility validity integrity therefore becomes a foundational condition of trustworthy responsibility governance.
