

RTOIM — Responsibility Traceability Origin Integrity Module

OriginID: OOF-OID-AGA-RTOIM-2026-06-17-0066Architecture **Ecosystem:** Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Responsibility Traceability Governance Layer

Governed Space: Responsibility Traceability Origin Integrity

Category: Governance & Enforcement

Subcategory: Responsibility Traceability Governance

Type: Responsibility Traceability Standard Module

Parent Standard: Responsibility Traceability Standard (RTS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 17 June 2026

Compatibility: OOF Methodology OS · Responsibility Traceability Standard (RTS) · Responsibility Governance Standard (RGS) · Responsibility Assignment Standard (RAS-A) · Responsibility Continuity Standard (RCS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Responsibility Traceability Origin Integrity Module (RTOIM) defines the structural conditions under which responsibility-traceability relationships remain attributable to identifiable, legitimate, traceable, governable, reconstructable, reviewable, and operationally valid responsibility sources throughout the responsibility lifecycle.

RTOIM governs responsibility-traceability origin.

The module establishes the integrity conditions required to determine where traceable responsibility history begins, which responsibility relationship serves as the traceability origin, and whether the source of responsibility traceability remains legitimate and governable.

Module Operational Role

RTOIM defines the traceability-origin governance layer of RTS.

Its role is to preserve visibility into the starting point of responsibility history.

Module Operational Space

RTOIM governs:

- traceability origin
- responsibility-history origin
- responsibility-source traceability
- traceability attribution
- responsibility provenance
- traceability legitimacy
- responsibility-chain origin
- traceability governance

The module applies wherever governance requires reconstruction of responsibility-history origins.

Module Function

The module applies wherever systems must preserve:

- identifiable traceability sources
- traceable responsibility origins
- reconstructable responsibility history
- accountable traceability relationships
- governance-valid traceability attribution
- operationally valid responsibility provenance

Its function is to ensure that governance can determine where responsibility history begins and which responsibility relationship serves as the origin of reconstruction.

Minimum Implementation Framework

1. Define the Traceability Origin Object

The organization must define which responsibility environments require traceability-origin governance.

This may include:

- organizational structures
- contractor networks
- project environments
- management systems
- governance frameworks
- AI governance systems
- Human-AI operational environments
- compliance environments

2. Define Traceability Origin Conditions

The system must define the conditions under which traceability origin remains valid.

This includes:

- traceability-source requirements
- attribution requirements
- legitimacy requirements
- reconstruction requirements
- governance requirements
- traceability-origin conditions

3. Define Origin Degradation Detection Logic

The system must define how traceability-origin failures are identified.

This may include:

- unidentified responsibility origins
- undocumented traceability relationships
- illegitimate responsibility sources
- governance-blind responsibility creation
- traceability-source ambiguity
- unverifiable traceability origins

4. Define Operational Response or Governance Logic

The system must define governance logic for traceability-origin failures.

Governance response may include:

- traceability review
- source verification
- governance intervention
- responsibility reconstruction
- corrective actions
- traceability reassessment
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- responsibility origins
- traceability relationships
- governance reviews
- validation activities

- intervention procedures
- resulting traceability states

A responsibility-traceability environment must not remain origin-valid if materially significant responsibility-history relationships cannot be attributed, reconstructed, reviewed, validated, or governed.

Use Case 1 — Contractor Responsibility Chain

Scenario

An investigation seeks to reconstruct how responsibility moved through multiple contractors, supervisors, and operational actors.

Application

RTOIM identifies the original responsibility source and establishes the starting point of responsibility reconstruction.

Result

Governance gains visibility into the origin of the responsibility chain.

Use Case 2 — Human-AI Operational

Environment

Scenario

Responsibilities move through humans, orchestration systems, and AI agents during operational execution.

Application

RTOIM reconstructs the original responsibility relationship from which the traceability chain begins.

Result

Governance gains visibility into the origin of responsibility history across intelligent operational ecosystems.

Canonical Closing Statement

Responsibility Traceability Origin Integrity Module (RTOIM) defines the structural conditions under which responsibility-traceability relationships remain attributable to identifiable, legitimate, traceable, governable, reconstructable, reviewable, and operationally valid responsibility sources throughout the responsibility lifecycle.

Responsibility history cannot be reconstructed if its origin cannot be identified. Responsibility Traceability Origin Integrity therefore becomes a foundational condition of trustworthy responsibility traceability governance.
