

RTSIM — Responsibility Traceability Scope Integrity Module

OriginID: OOF-OID-AGA-RTSIM-2026-06-17-0067Architecture **Ecosystem:**

Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Responsibility Traceability Governance Layer

Governed Space: Responsibility Traceability Scope Integrity

Category: Governance & Enforcement

Subcategory: Responsibility Traceability Governance

Type: Responsibility Traceability Standard Module

Parent Standard: Responsibility Traceability Standard (RTS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 17 June 2026

Compatibility: OOF Methodology OS · Responsibility Traceability

Standard (RTS) · Responsibility Continuity Standard

(RCS) · Evidence Accountability Standard (EAS) · Accountability

Governance Standard (AGS-A) · INTEGROS® —

Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Responsibility Traceability Scope Integrity Module (RTSIM) defines

the structural conditions under which traceable responsibilities, responsibility-history boundaries, responsibility-chain relationships, responsibility transitions, traceability limitations, traceability expectations, traceability coverage, and traceability outcomes remain identifiable, traceable, governable, reconstructable, reviewable, and operationally valid throughout the responsibility lifecycle.

RTSIM governs responsibility-traceability scope.

The module establishes the integrity conditions required to determine exactly what responsibility history is traceable, which responsibility relationships are included within the traceability chain, where traceability boundaries begin, and where traceability boundaries end.

Module Operational Role

RTSIM defines the traceability-scope governance layer of RTS.

Its role is to preserve visibility of responsibility-history

boundaries and traceability coverage.

Module Operational Space

RTSIM governs:

- traceability scope
- traceability boundaries
- responsibility-history coverage
- responsibility-chain boundaries
- traceability limitations
- traceability expectations
- reconstruction coverage
- traceability governance

The module applies wherever governance requires clarification of responsibility-traceability boundaries.

Module Function

The module applies wherever systems must preserve:

- clearly defined traceability boundaries
- visible reconstruction coverage
- reconstructable responsibility domains
- accountable traceability structures
- governance-valid traceability limits
- operational traceability clarity

Its function is to ensure that governance can determine exactly which responsibility relationships are traceable and which are not.

Minimum Implementation Framework

1. Define the Traceability Scope Object

The organization must define which responsibility environments require traceability-scope governance.

This may include:

- organizational structures
- contractor networks
- project environments
- governance frameworks
- compliance systems
- AI governance systems
- Human-AI operational environments
- investigation environments

2. Define Traceability Scope Conditions

The system must define the conditions under which traceability scope remains valid.

This includes:

- traceability-boundary requirements
- reconstruction requirements
- coverage requirements
- responsibility-chain requirements
- governance requirements
- traceability-scope conditions

3. Define Scope Degradation Detection Logic

The system must define how traceability-scope failures are identified.

This may include:

- incomplete responsibility chains
- traceability gaps
- unclear traceability boundaries
- fragmented reconstruction coverage
- governance-blind traceability structures
- responsibility-history ambiguity

4. Define Operational Response or Governance Logic

The system must define governance logic for traceability-scope failures.

Governance response may include:

- traceability review
- scope verification
- governance intervention
- reconstruction clarification
- corrective actions
- traceability reassessment
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- responsibility-history boundaries
- responsibility-chain relationships

- governance reviews
- validation activities
- intervention procedures
- resulting traceability states

A responsibility-traceability environment must not remain scope-valid if materially significant traceability boundaries cannot be reconstructed, reviewed, validated, clarified, or governed.

Use Case 1 — Multi-Layer Contractor

Investigation

Scenario

An investigation seeks to reconstruct responsibility across multiple contractors, subcontractors, supervisors, and operational actors.

Application

RTSIM determines exactly which responsibility relationships are included within the reconstruction chain and identifies traceability boundaries.

Result

Governance gains visibility into responsibility-history coverage and reconstruction limitations.

Use Case 2 — Human-AI Operational

Environment

Scenario

Responsibility passes through humans, orchestration systems, AI agents, and governance actors throughout operational execution.

Application

RTSIM determines which responsibility relationships remain traceable and where reconstruction boundaries exist.

Result

Governance gains visibility into responsibility-history coverage across intelligent operational ecosystems.

Canonical Closing Statement

Responsibility Traceability Scope Integrity Module (RTSIM) defines

the structural conditions under which traceable responsibilities, responsibility-history boundaries, responsibility-chain relationships, responsibility transitions, traceability limitations, traceability expectations, traceability coverage, and traceability outcomes remain identifiable, traceable, governable, reconstructable, reviewable, and operationally valid throughout the responsibility lifecycle.

Responsibility history cannot be reconstructed if reconstruction boundaries are unclear. Responsibility Traceability Scope Integrity therefore becomes a foundational condition of trustworthy responsibility traceability governance.
