

Skill Accountability Integrity Module (SAAIM)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-MEM-SAAIM-2026-06-12-0005

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Memory Governance Intelligence Architecture (MGIA™)

Operational Layer: Skill Formation Governance Layer

Governed Space: Skill Accountability Integrity

Category: AI & Interpretation

Subcategory: Skill Accountability Governance

Type: Skill Formation Integrity Module

Parent Standard: Skill Formation Integrity Standard (SFIS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 12 June 2026

Compatibility: OOF Methodology OS · Skill Formation Integrity Standard (SFIS) · Skill Acquisition Integrity Module (SAIM)

· Skill Development Integrity Module (SDIM) · Skill Transfer Integrity Module (STIM) · Skill Performance Integrity Module (SPIM)

· INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Skill Accountability Integrity Module (SAAIM) defines the structural conditions under which skill acquisition, skill development, skill transfer, skill utilization, skill performance, competence claims, capability validation, and operational execution remain attributable, traceable, reviewable, governable, and operationally accountable throughout the skill formation lifecycle.

SAAIM governs skill accountability.

The module ensures that capability remains connected to identifiable actors, identifiable learning processes, identifiable performance outcomes, and accountable operational responsibility.

A system satisfies SAAIM only if:

- capability ownership remains identifiable
- competence claims remain traceable
- accountability relationships remain visible
- responsibility assignments remain assessable
- governance oversight remains possible
- skill accountability remains operationally valid

A capability environment that cannot identify who acquired, developed, transferred, validated, or utilized a skill does not satisfy SAAIM.

Module Operational Role

SAAIM defines the accountability-governance layer of SFIS.

Its role is to preserve accountability throughout capability formation and utilization.

Module Operational Space

SAAIM governs:

- skill accountability
- competence accountability
- capability ownership
- capability responsibility
- skill governance
- performance accountability
- capability traceability
- operational responsibility

The module applies wherever skills influence decisions, actions, or outcomes.

Module Function

The module applies wherever systems must preserve:

- accountable capability
- traceable competence claims
- visible responsibility chains
- governance-valid skill utilization
- accountable operational execution
- trustworthy capability environments

Its function is to ensure that skills remain connected to responsibility and accountability.

Minimum Implementation Framework

1. Define the Skill Accountability Object

The organization must define which capability environments require accountability governance.

This may include:

- professional qualifications
 - industrial operations
 - AI capability systems
 - autonomous agents
 - robotics environments
 - Human-AI operational systems
-

- educational systems
- organizational competence programs

2. Define Skill Accountability Conditions

The system must define the conditions under which accountability remains valid.

This includes:

- attribution requirements
- responsibility requirements
- traceability requirements
- validation requirements
- oversight requirements
- governance-valid accountability conditions

3. Define Accountability Degradation Detection Logic

The system must define how accountability failures are identified.

This may include:

- unverifiable competence claims
- anonymous capability utilization
- unclear responsibility assignments
- governance gaps
- accountability failures
- capability ownership ambiguity

4. Define Operational Response or Governance Logic

The system must define governance logic for accountability-integrity failures.

Governance response may include:

- accountability review
- competence verification
- governance intervention
- escalation
- responsibility reassignment
- corrective actions
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- competence claims
- capability assignments
- validation activities
- governance reviews
- intervention procedures
- resulting accountability states

A skill-formation environment must not remain accountability-valid if materially significant skills, capabilities, or competence claims cannot be attributed, reviewed, validated, or governed.

Use Case 1 — Certified Welding Environment

Scenario

A welder performs certified welding operations in safety-critical industrial production.

Application

SAAIM governs accountability of qualifications, competence claims, performance outcomes, and operational responsibility.

Result

The environment gains stronger trustworthiness and reduced exposure to unclear competence accountability.

Use Case 2 — Autonomous Robotics Operations

Scenario

An autonomous robotics platform performs tasks using capabilities acquired through learning, adaptation, and operational experience.

Application

SAAIM governs accountability of acquired capabilities, operational decisions, and performance outcomes.

Result

The environment gains stronger governance visibility and reduced exposure to unaccountable capability utilization.

Canonical Closing Statement

Skill Accountability Integrity Module (SAAIM) defines the structural conditions under which skill acquisition, skill development, skill transfer, skill utilization, skill performance, competence claims, capability validation, and operational execution remain attributable, traceable, reviewable, governable, and operationally accountable throughout the skill formation lifecycle.

Capability without accountability creates risk.

Skill accountability integrity therefore becomes a foundational integrity condition of trustworthy human capability, AI capability, autonomous systems, robotics, and future intelligence ecosystems.
