

SCIM — Shared Cognition Integrity Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AI-SCIM-2026-06-05-0001

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Cognitive Governance Intelligence Architecture (CLIA®)

Operational Layer: Human-AI Cognition Governance Layer

Governed Space: Shared Cognition Integrity

Category: AI & Interpretation

Subcategory: Shared Cognition Governance

Type: Human-AI Cognition Integrity Module

Parent Standard: Human-AI Cognition Integrity Standard (HAICS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 5 June 2026

Compatibility: OOF Methodology OS ·

Canonical Language: English (UCL)

Canonical Definition

Shared Cognition Integrity Module (SCIM) defines the structural conditions under which cognition jointly produced by humans and AI systems remains traceable, reconstructable, accountable, reality-connected, governance-valid, and operationally reliable throughout shared cognition processes.

SCIM governs shared cognition.

The module ensures that cognition emerging through Human-AI interaction remains understandable and governable rather than becoming an opaque mixture of human and AI contributions.

A system satisfies SCIM only if:

- shared cognition remains traceable
- cognitive contributions remain identifiable

- cognition pathways remain reconstructable
- accountability remains preservable
- cognition outcomes remain assessable
- shared cognition remains operationally valid

A Human-AI cognition environment that cannot explain how a conclusion emerged does not satisfy SCIM.

Module Operational Role

SCIM defines the shared-cognition governance layer of HAICS.

Its role is to preserve integrity within jointly produced cognition.

Module Operational Space

SCIM governs:

- shared cognition
- Human-AI cognition flows
- cognition co-production
- cognition traceability
- collaborative reasoning
- collaborative interpretation
- shared understanding
- cognition accountability

The module applies wherever cognition emerges through active Human-AI collaboration.

Module Function

The module applies wherever systems must preserve:

- accountable shared cognition
- reconstructable cognition pathways
- contribution visibility
- governance-valid collaboration
- reality-connected cognition
- operationally reliable Human-AI understanding

Its function is to ensure that cognition jointly produced by humans and AI remains governable.

Minimum Implementation Framework

1. Define the Shared Cognition Object

The organization must define which Human-AI cognition processes require governance.

This may include:

- decision support
 - collaborative reasoning
 - collaborative interpretation
 - planning activities
 - analytical activities
 - research activities
-

- operational recommendations
- Human-AI problem solving

2. Define Shared Cognition Conditions

The system must define the conditions under which shared cognition remains valid.

This includes:

- traceability requirements
- contribution requirements
- accountability requirements
- reconstruction requirements
- transparency requirements
- governance-valid cognition conditions

3. Define Shared Cognition Degradation Detection Logic

The system must define how shared cognition degradation is identified.

This may include:

- contribution ambiguity
- cognition opacity
- accountability gaps
- cognition-path loss
- Human-AI misunderstanding
- reconstruction failures

4. Define Operational Response or Governance Logic

The system must define governance logic for shared-cognition failures.

Governance response may include:

- cognition review
- contribution analysis
- reconstruction activities
- governance intervention
- escalation
- output restriction
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- human contributions
- AI contributions
- cognition interactions
- governance reviews
- intervention activities
- resulting cognition outcomes

A Human-AI cognition environment must not remain cognition-valid if materially significant shared cognition cannot be reconstructed, explained, or governed.

Use Case 1 — Executive AI Copilot Environment

Scenario

An executive collaborates with an AI copilot to evaluate risks, analyze opportunities, and generate strategic recommendations.

Application

SCIM governs shared cognition pathways, contribution visibility, and accountability throughout collaborative decision-support activities.

Result

The organization gains stronger transparency, improved governance visibility, and reduced exposure to cognition ambiguity.

Use Case 2 — Human-AI Research Team

Scenario

Researchers and AI systems jointly analyze information, generate hypotheses, evaluate evidence, and develop conclusions.

Application

SCIM governs cognition traceability, shared reasoning integrity, and contribution accountability across the research process.

Result

The environment gains stronger collaborative cognition integrity, improved reproducibility, and reduced exposure to unclear authorship of conclusions.

Canonical Closing Statement

Shared Cognition Integrity Module (SCIM) defines the structural conditions under which cognition jointly produced by humans and AI systems remains traceable, reconstructable, accountable, reality-connected, governance-valid, and operationally reliable throughout shared cognition processes.

Human-AI cognition cannot remain governable if shared cognition becomes opaque. Shared cognition therefore becomes a foundational integrity condition of governable Human-AI cognition.
