

SCM — Scope Conflict Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-GOA-GSS-SCM-2026-06-22-0005

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Governance Architecture (GOA™)

Operational Layer: Governance Scope Governance Layer

Governed Space: Governance Scope Conflict

Category: Governance & Enforcement

Subcategory: Governance Scope Governance

Type: Governance Scope Standard Module

Parent Standard: Governance Scope Standard (GSS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 22 June 2026

Compatibility: OOF Methodology OS · Governance Scope Standard (GSS)

· Governance Boundary Standard (GBS) · Governance Authority Standard (GAS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Scope Conflict Module (SCM) defines the structural conditions under which governance-scope conflicts remain identifiable, attributable, traceable, reviewable, governable, resolvable, auditable, and operationally valid throughout the governance lifecycle.

SCM governs governance-scope conflicts.

The module establishes the foundational conditions required to determine where governance scopes overlap, where governance coverage becomes disputed, how governance-scope conflicts emerge, and whether governance-scope conflicts remain reconstructable throughout operational reality.

Governance scope may be defined.

Governance scope may be validated.

Governance scope may also conflict.

SCM governs those conflicts.

Module Operational Role

SCM defines the scope-conflict governance layer of GSS.

Its role is to establish governance-valid scope-conflict visibility throughout governance environments.

Module Operational Space

SCM governs:

- governance-scope conflicts
- governance-coverage conflicts
- governance-domain overlap
- governance-responsibility disputes
- governance-scope ambiguity
- governance-scope auditability
- governance-scope traceability
- governance-conflict reconstruction

The module applies wherever governance scopes overlap, collide, or become disputed.

Module Function

The module applies wherever systems must preserve:

- identifiable governance-scope conflicts
- traceable governance disputes
- reconstructable conflict history
- attributable conflict ownership
- governance-valid conflict records
- operational conflict visibility

Its function is to ensure that governance can identify, reconstruct, and govern governance-scope conflicts throughout operational reality.

Minimum Implementation Framework

1. Define the Scope Conflict Object

The organization must define which governance environments require governance-scope conflict governance.

This may include:

- organizations
- institutions
- governments
- regulatory environments
- multi-department governance structures
- AI governance systems
- autonomous-agent ecosystems
- Human-AI governance environments

2. Define Scope Conflict Conditions

The system must define the conditions under which governance-scope conflicts remain validly identifiable.
This includes:

- conflict-identification requirements
- coverage requirements
- attribution requirements
- traceability requirements
- review requirements
- governance-valid conflict conditions

3. Define Conflict Degradation Detection Logic

The system must define how governance-scope conflict failures are identified.
This may include:

- overlapping governance scope
- conflicting governance coverage
- disputed governance responsibilities
- governance-domain ambiguity
- missing conflict records
- governance-invalid conflict activities

4. Define Operational Response or Governance Logic

The system must define governance logic for governance-scope conflicts.
Governance response may include:

- conflict review
- conflict validation
- governance intervention
- conflict-resolution procedures
- conflict reconstruction
- coverage verification
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- governance-scope conflicts
- conflict reviews
- intervention procedures
- validation activities
- conflict-resolution actions
- resulting governance states

A governance environment must not remain conflict-valid if materially significant governance-scope conflicts cannot be reconstructed, reviewed, attributed, resolved, preserved, or governed.

Use Case 1 — Organizational Governance Coverage Conflict

Scenario

Two governance departments claim responsibility for the same operational domain, creating uncertainty regarding governance ownership.

Application

SCM identifies overlapping governance scope, reconstructs governance-ownership claims, and governs conflict-resolution procedures.

Result

The organization gains clearer governance ownership, reduced governance ambiguity, and improved governance coordination.

Use Case 2 — Human-AI Governance Environment

Scenario

Human governance actors and AI governance systems claim responsibility for the same operational decision domain.

Application

SCM governs governance-scope conflict identification, governance-domain attribution, and governance-conflict resolution.

Result

The organization gains stronger governance visibility, reduced governance ambiguity, and improved Human-AI governance coordination.

Canonical Closing Statement

Scope Conflict Module (SCM) defines the structural conditions under which governance-scope conflicts remain identifiable, attributable, traceable, reviewable, governable, resolvable, auditable, and operationally valid throughout the governance lifecycle.

Governance scope that cannot resolve conflicts cannot remain governance-valid. Scope Conflict therefore becomes a foundational condition of trustworthy governance scope governance.
