

Skill Development Integrity Module (SDIM)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-MEM-SDIM-2026-06-12-0002

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Memory Governance Intelligence Architecture (MGIA™)

Operational Layer: Skill Formation Governance Layer

Governed Space: Skill Development Integrity

Category: AI & Interpretation

Subcategory: Skill Development Governance

Type: Skill Formation Integrity Module

Parent Standard: Skill Formation Integrity Standard (SFIS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 12 June 2026

Compatibility: OOF Methodology OS · Skill Formation Integrity Standard (SFIS) · Skill Acquisition Integrity Module (SAIM)

· Memory Evolution Integrity Standard (MEIS) · Memory Learning Integrity Module (MLIM) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Skill Development Integrity Module (SDIM) defines the structural conditions under which acquired skills are improved, refined, strengthened, expanded, optimized, and matured in a traceable, measurable, accountable, reconstructable, and operationally valid manner throughout the skill formation lifecycle.

SDIM governs skill development.

The module ensures that capability growth remains structured, explainable, and measurable rather than random, unverifiable, inconsistent, or operationally unreliable.

A system satisfies SDIM only if:

- skill development remains measurable
- development activities remain traceable
- development outcomes remain assessable
- capability progression remains reconstructable
- development governance remains possible
- skill development remains operationally valid

A capability environment that cannot demonstrate how skills improved over time does not satisfy SDIM.

Module Operational Role

SDIM defines the skill-development governance layer of SFIS.

Its role is to preserve integrity of capability growth and maturation.

Module Operational Space

SDIM governs:

- skill development
- capability improvement
- expertise growth
- competence maturation
- capability refinement
- development accountability
- development traceability
- development governance

The module applies wherever acquired skills evolve into higher capability levels.

Module Function

The module applies wherever systems must preserve:

- measurable capability growth
- explainable expertise development
- governance-valid competence progression
- reconstructable skill evolution
- accountable development activities
- reliable performance improvement

Its function is to ensure that capability development remains visible, measurable, and trustworthy.

Minimum Implementation Framework

1. Define the Skill Development Object

The organization must define which skill-development environments require governance.

This may include:

- professional training programs
 - AI capability development
 - autonomous agents
 - robotics environments
 - organizational competence programs
 - Human-AI learning systems
 - educational environments
-

- operational development systems

2. Define Skill Development Conditions

The system must define the conditions under which development remains valid.

This includes:

- progression requirements
- measurement requirements
- validation requirements
- accountability requirements
- traceability requirements
- governance-valid development conditions

3. Define Development Degradation Detection Logic

The system must define how development failures are identified.

This may include:

- stagnant capability growth
- unverifiable improvement claims
- inconsistent progression
- competence regression
- development drift
- unreliable expertise formation

4. Define Operational Response or Governance Logic

The system must define governance logic for development-integrity failures.

Governance response may include:

- development review
- competency assessment
- governance intervention
- escalation
- corrective development actions
- retraining activities
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- development activities
- capability assessments
- validation reviews
- governance actions
- intervention procedures
- resulting capability states

A skill-formation environment must not remain development-valid

if materially significant capability improvements cannot be measured, reconstructed, reviewed, or governed.

Use Case 1 — Advanced Welding Competence Development

Scenario

A welder progresses from basic welding operations to advanced certifications, complex materials, and specialized procedures.

Application

SDIM governs capability progression, competence growth, and expertise development.

Result

The environment gains stronger competence transparency and reduced exposure to unverifiable expertise claims.

Use Case 2 — Autonomous Robotics Capability Growth

Scenario

A robotics system continuously improves navigation, manipulation, coordination, and operational execution capabilities.

Application

SDIM governs measurable capability development and progression tracking.

Result

The robot gains stronger performance reliability and improved explainability of capability growth.

Canonical Closing Statement

Skill Development Integrity Module (SDIM) defines the structural conditions under which acquired skills are improved, refined, strengthened, expanded, optimized, and matured in a traceable, measurable, accountable, reconstructable, and operationally valid manner.

**Capability is not defined by acquisition alone but by development over time.
Skill development integrity therefore becomes a foundational integrity condition
of trustworthy capability growth and expertise formation.**
