

SDM — Scope Definition Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-GOA-GSS-SDM-2026-06-22-0001

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Governance Architecture (GOA™)

Operational Layer: Governance Scope Governance Layer

Governed Space: Governance Scope Definition

Category: Governance & Enforcement

Subcategory: Governance Scope Governance

Type: Governance Scope Standard Module

Parent Standard: Governance Scope Standard (GSS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 22 June 2026

Compatibility: OOF Methodology OS · Governance Scope Standard (GSS)

· Governance Boundary Standard (GBS) · Governance Authority Standard (GAS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Scope Definition Module (SDM) defines the structural conditions under which governance scope remains identifiable, attributable, traceable, reviewable, governable, enforceable, auditable, and operationally valid throughout the governance lifecycle.

SDM governs governance scope definition.

The module establishes the foundational conditions required to determine what activities, decisions, systems, assets, responsibilities, actors, environments, and governance objects belong within governance scope.

Governance authority may exist.

Governance boundaries may exist.

Governance scope must also be defined.

SDM governs that definition.

Module Operational Role

SDM defines the scope-definition governance layer of GSS.

Its role is to establish governance-valid scope identification throughout governance environments.

Module Operational Space

SDM governs:

- governance scope definition
- governance coverage definition
- governance-domain identification
- governance-object identification
- governance inclusion criteria
- governance exclusion criteria
- governance-scope traceability
- governance-scope reconstruction

The module applies wherever governance scope must be formally defined.

Module Function

The module applies wherever systems must preserve:

- clearly defined governance scope
- identifiable governance domains
- attributable governance ownership
- traceable scope-definition history
- governance-valid scope records
- operational governance visibility

Its function is to ensure that governance can identify what legitimately belongs within governance jurisdiction.

Minimum Implementation Framework

1. Define the Scope Definition Object

The organization must define which governance environments require governance-scope definition.

This may include:

- organizations
- institutions
- governments
- regulatory environments
- corporate governance structures
- AI governance systems
- autonomous-agent ecosystems
- Human-AI governance environments

2. Define Scope Definition Conditions

The system must define the conditions under which governance-scope definitions remain valid.
This includes:

- scope requirements
- inclusion requirements
- exclusion requirements
- ownership requirements
- traceability requirements
- governance-valid scope conditions

3. Define Scope Degradation Detection Logic

The system must define how governance-scope failures are identified.
This may include:

- undefined governance domains
- governance-scope ambiguity
- governance blind spots
- unmanaged governance objects
- missing scope records
- governance-invalid scope activities

4. Define Operational Response or Governance Logic

The system must define governance logic for governance-scope failures.
Governance response may include:

- scope review
- scope validation
- governance intervention
- corrective actions
- scope reconstruction
- ownership verification
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- governance-scope definitions
- governance-domain records
- governance reviews
- intervention procedures
- validation activities
- resulting scope states

A governance environment must not remain scope-valid if materially significant governance-scope definitions

cannot be reconstructed, reviewed, validated, preserved, attributed, or governed.

Use Case 1 — Enterprise Governance Environment

Scenario

A large organization must determine which business activities, responsibilities, and decisions fall within governance oversight.

Application

SDM defines governance coverage, governance domains, governance ownership, and governance inclusion criteria.

Result

The organization gains clearer governance coverage, reduced governance ambiguity, and stronger governance accountability.

Use Case 2 — Human-AI Governance Environment

Scenario

An organization deploys AI systems and must determine which AI activities, decisions, and behaviors belong within governance oversight.

Application

SDM defines governance scope, governance ownership, and governance-domain inclusion criteria for Human-AI environments.

Result

The organization gains clearer governance visibility, reduced governance blind spots, and stronger Human-AI governance control.

Canonical Closing Statement

Scope Definition Module (SDM) defines the structural conditions under which governance scope remains identifiable, attributable, traceable, reviewable, governable, enforceable, auditable, and operationally valid throughout the governance lifecycle.

Governance scope cannot be governed until governance scope has been defined. Scope Definition therefore becomes a foundational condition of trustworthy governance scope governance.
