

Skill Performance Integrity Module (SPIM)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-MEM-SPIM-2026-06-12-0004

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Memory Governance Intelligence Architecture (MGIA™)

Operational Layer: Skill Formation Governance Layer

Governed Space: Skill Performance Integrity

Category: AI & Interpretation

Subcategory: Skill Performance Governance

Type: Skill Formation Integrity Module

Parent Standard: Skill Formation Integrity Standard (SFIS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 12 June 2026

Compatibility: OOF Methodology OS · Skill Formation Integrity Standard (SFIS) · Skill Acquisition Integrity Module (SAIM)

· Skill Development Integrity Module (SDIM) · Skill Transfer Integrity Module (STIM) · Cognitive Evolution Governance Standard (CEGS)

· INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Skill Performance Integrity Module (SPIM) defines the structural conditions under which acquired and developed skills produce reliable, repeatable, measurable, accountable, traceable, and operationally valid performance outcomes throughout the skill lifecycle.

SPIM governs skill performance.

The module ensures that capability is not merely claimed or possessed, but consistently demonstrated through operational execution.

A system satisfies SPIM only if:

- performance remains measurable
- performance outcomes remain assessable
- capability execution remains repeatable
- performance degradation remains detectable
- performance governance remains possible
- skill performance remains operationally valid

A capability environment that cannot consistently demonstrate performance does not satisfy SPIM.

Module Operational Role

SPIM defines the performance-governance layer of SFIS.

Its role is to preserve integrity between capability and actual execution.

Module Operational Space

SPIM governs:

- skill performance
- operational execution
- competence demonstration
- performance consistency
- execution reliability
- performance accountability
- performance traceability
- performance governance

The module applies wherever skills are operationally executed.

Module Function

The module applies wherever systems must preserve:

- repeatable performance
- measurable competence
- governance-valid execution
- accountable outcomes
- reliable capability utilization
- trustworthy operational results

Its function is to ensure that skills produce consistent and demonstrable outcomes.

Minimum Implementation Framework

1. Define the Skill Performance Object

The organization must define which performance environments require governance.

This may include:

- industrial operations
 - robotics systems
 - autonomous agents
 - Human-AI environments
 - organizational competence programs
 - professional certification environments
 - educational systems
-

- operational execution systems

2. Define Skill Performance Conditions

The system must define the conditions under which performance remains valid.

This includes:

- performance requirements
- repeatability requirements
- measurement requirements
- accountability requirements
- validation requirements
- governance-valid performance conditions

3. Define Performance Degradation Detection Logic

The system must define how performance failures are identified.

This may include:

- inconsistent execution
- competence degradation
- operational errors
- unreliable outcomes
- performance drift
- capability-performance mismatch

4. Define Operational Response or Governance Logic

The system must define governance logic for performance-integrity failures.

Governance response may include:

- performance review
- competency assessment
- governance intervention
- escalation
- retraining procedures
- capability correction
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- performance activities
- execution outcomes
- validation reviews
- governance actions
- intervention procedures
- resulting performance states

A skill-formation environment must not remain performance-valid

if materially significant outcomes cannot be measured, validated, reviewed, or governed.

Use Case 1 — Certified Industrial Welder

Scenario

A welder possesses qualifications and experience but must consistently demonstrate reliable welding quality in real-world production.

Application

SPIM governs performance reliability, outcome quality, and competence validation.

Result

The environment gains stronger confidence in operational capability and reduced exposure to qualification-performance gaps.

Use Case 2 — Autonomous Robotics Execution Platform

Scenario

A robot possesses navigation, manipulation, and operational skills that must consistently produce successful outcomes.

Application

SPIM governs execution reliability, performance consistency, and operational accountability.

Result

The robot gains stronger operational trustworthiness and reduced exposure to capability-performance mismatch.

Canonical Closing Statement

Skill Performance Integrity Module (SPIM) defines the structural conditions under which acquired and developed skills produce reliable, repeatable, measurable, accountable, traceable, and operationally valid performance outcomes throughout the skill lifecycle.

A skill has value only when it can be reliably performed.

Skill performance integrity therefore becomes a foundational integrity condition of trustworthy capability, competence, and operational execution.
