

Skill Transfer Integrity Module (STIM)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-MEM-STIM-2026-06-12-0003

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Memory Governance Intelligence Architecture (MGIA™)

Operational Layer: Skill Formation Governance Layer

Governed Space: Skill Transfer Integrity

Category: AI & Interpretation

Subcategory: Skill Transfer Governance

Type: Skill Formation Integrity Module

Parent Standard: Skill Formation Integrity Standard (SFIS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 12 June 2026

Compatibility: OOF Methodology OS · Skill Formation Integrity Standard (SFIS) · Skill Acquisition Integrity Module (SAIM)

· Skill Development Integrity Module (SDIM) · Memory Integrity Standard (MIS) · Human Cognition Integrity Standard (HCIS)

· INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Skill Transfer Integrity Module (STIM) defines the structural conditions under which skills, competencies, expertise, operational knowledge, and capabilities remain transferable, reproducible, understandable, traceable, accountable, and operationally valid between individuals, groups, organizations, AI systems, autonomous agents, and future intelligence environments.

STIM governs skill transfer.

The module ensures that capability can move from one holder to another without unacceptable degradation, distortion, loss of context, or loss of operational validity.

A system satisfies STIM only if:

- skill transfer remains possible
- transferred capability remains reproducible
- transfer pathways remain traceable
- transfer quality remains assessable
- transfer governance remains possible

- skill transfer remains operationally valid

A capability environment that cannot reliably transfer skills does not satisfy STIM.

Module Operational Role

STIM defines the skill-transfer governance layer of SFIS.

Its role is to preserve integrity of capability transfer across learning environments.

Module Operational Space

STIM governs:

- skill transfer
- capability transmission
- expertise sharing
- knowledge operationalization
- competence replication
- transfer accountability
- transfer traceability
- transfer governance

The module applies wherever capability must move between actors or systems.

Module Function

The module applies wherever systems must preserve:

- transferable expertise
- reproducible capability
- governance-valid knowledge transmission
- continuity of competence
- accountable capability transfer
- reliable skill propagation

Its function is to ensure that skills remain transferable without losing operational value.

Minimum Implementation Framework

1. Define the Skill Transfer Object

The organization must define which capability-transfer environments require governance.

This may include:

- apprenticeship systems
 - educational systems
 - AI training environments
 - Human-AI learning systems
 - organizational mentoring programs
 - robotics capability transfer
-

- knowledge-sharing environments
- collective intelligence systems

2. Define Skill Transfer Conditions

The system must define the conditions under which transfer remains valid.

This includes:

- transfer requirements
- reproducibility requirements
- traceability requirements
- accountability requirements
- validation requirements
- governance-valid transfer conditions

3. Define Transfer Degradation Detection Logic

The system must define how transfer failures are identified.

This may include:

- competence loss
- transfer distortion
- capability degradation
- contextual misunderstanding
- transfer gaps
- non-reproducible expertise

4. Define Operational Response or Governance Logic

The system must define governance logic for transfer-integrity failures.

Governance response may include:

- transfer review
- competency validation
- governance intervention
- escalation
- retraining procedures
- transfer correction
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- transfer activities
- training events
- validation reviews
- governance actions
- intervention procedures
- resulting capability states

A skill-formation environment must not remain transfer-valid

if materially significant skills cannot be reproduced, validated, reviewed, or governed after transfer.

Use Case 1 — Master Welder to Apprentice

Scenario

An experienced welder transfers specialized welding knowledge and operational competence to a trainee.

Application

STIM governs transfer quality, competence preservation, and validation of acquired capability.

Result

The environment gains stronger skill continuity and reduced exposure to competence degradation.

Use Case 2 — Human-to-AI Capability Transfer

Scenario

Human experts transfer operational procedures, methodologies, and expertise into AI-supported operational systems.

Application

STIM governs capability transmission, validation, and preservation of operational meaning.

Result

The environment gains stronger capability continuity and reduced exposure to knowledge-loss during transfer.

Canonical Closing Statement

Skill Transfer Integrity Module (STIM) defines the structural conditions under which skills, competencies, expertise, operational knowledge, and capabilities remain transferable, reproducible, understandable, traceable, accountable, and operationally valid between individuals, groups, organizations, AI systems, autonomous agents, and future intelligence environments.

**A capability that cannot be transferred eventually disappears.
Skill transfer integrity therefore becomes a foundational integrity condition
of long-term capability continuity and intelligence development.**
