

SFIS — Skill Formation Integrity Standard

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-MEM-SFIS-2026-06-12-0010

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Memory Governance Intelligence Architecture (MGIA™)

Operational Layer: Skill Formation Governance Layer

Governed Space: Skill Formation Integrity

Category: AI & Interpretation

Subcategory: Skill Formation Governance Architecture

Type: Parent Standard

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 12 June 2026

Compatibility: OOF Methodology OS · Memory Integrity Standard (MIS)

- Memory Evolution Integrity Standard (MEIS)
- Agent Memory Integrity Standard (AMIS)
- User Memory Integrity Standard (UMIS) · Cognitive Evolution Governance Standard (CEGS)
- Agent Cognition Integrity Standard (ACIS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Skill Formation Integrity Standard (SFIS) defines the structural conditions under which knowledge, experience, practice, learning, adaptation, repetition, memory utilization, and operational execution remain reliable, transferable, traceable, accountable, measurable, and operationally valid throughout the skill formation lifecycle.

SFIS governs skill formation.

The standard establishes the integrity conditions required for transforming memory and learning into repeatable capability.

Memory stores knowledge.

Skills operationalize knowledge.

SFIS governs that transformation.

A. Standard Abstract

Intelligence alone is insufficient.
Knowledge alone is insufficient.
Memory alone is insufficient.
Capability emerges when knowledge becomes skill.
Humans develop skills.
Organizations develop skills.
AI systems may develop skills.
Autonomous agents may develop skills.

Without governance:

- skills may become unreliable
- learning may not translate into capability
- performance may become inconsistent
- skill transfer may fail
- competence may become unverifiable

SFIS exists to govern these conditions.

B. Core Principle

Skill formation becomes valid only when knowledge, experience, learning, adaptation, memory utilization, and execution remain traceable, measurable, accountable, repeatable, and operationally valid throughout the skill formation lifecycle.

C. Scope

This standard may apply to:

- humans
- AI systems
- autonomous agents
- robotics
- Human-AI environments
- organizations
- educational systems
- future intelligence ecosystems

SFIS applies wherever capability is developed through learning and memory.

D. Why This Standard Exists

Memory creates learning.
Learning creates capability.
Capability creates performance.
Performance creates outcomes.

The challenge is not learning alone.
The challenge is transforming learning into reliable skill.
SFIS exists because skill formation has become a distinct governance space.

E. Skill Formation Integrity Logic

Skill formation integrity exists only when the following remain materially preservable:

1. Skill Acquisition Integrity

Skills are acquired through valid processes.

2. Skill Development Integrity

Skills improve through valid development.

3. Skill Transfer Integrity

Skills remain transferable.

4. Skill Performance Integrity

Skills remain operationally reliable.

5. Skill Accountability Integrity

Skill formation remains accountable.

F. Operational Architecture Space

SFIS defines the operational architecture space for:

- skill formation governance
- capability development
- learning-to-skill transformation
- skill transfer
- performance reliability
- competence validation
- skill accountability
- operational capability development

This space exists because intelligence becomes useful only when it can be operationalized through skill.

SFIS governs whether that process remains valid.

G. Difference Between Memory, Learning, and Skill

Memory preserves knowledge.

Learning transforms knowledge.

Skill operationalizes knowledge.

MIS governs memory.

MEIS governs learning and memory evolution.

SFIS governs formation of capability.

All three are required.

H. Runtime Position

SFIS operates above:

- MIS
 - AMIS
-

- UMIS
- MEIS

SFIS governs the final transformation of memory and learning into operational capability.

I. Skill Formation Failure Rule

Skill formation failure occurs when capability cannot be reliably produced.

Examples include:

- unreliable performance
- failed skill transfer
- competence degradation
- learning-performance gaps
- unverifiable capability
- inconsistent execution

SFIS exists to expose and govern these conditions.

J. Validity Logic

A skill-formation environment is valid under SFIS when:

- skill acquisition remains traceable
- skill development remains measurable
- performance remains repeatable
- capability remains transferable
- accountability remains identifiable
- skill formation remains operationally valid

A skill-formation environment becomes invalid when:

- competence cannot be demonstrated
- performance becomes unreliable
- capability cannot be transferred
- accountability disappears

K. Relationship to Other OOF Standards

SFIS derives from:

Memory Integrity Standard (MIS)

Memory Evolution Integrity Standard (MEIS)

and directly supports:

- Agent Cognition Integrity Standard (ACIS)
- Cognitive Evolution Governance Standard (CEGS)
- Future Autonomous Capability Architectures

SFIS governs capability formation.

Other memory standards govern memory and learning.

L. Foundational Principle

Knowledge creates potential. Skills create capability. Capability creates outcomes.

Canonical Closing Statement

Skill Formation Integrity Standard (SFIS) defines the structural conditions under which knowledge, experience, practice, learning, adaptation, repetition, memory utilization, and operational execution become reliable, transferable, traceable, accountable, measurable, and operationally valid skills throughout the skill formation lifecycle.

Intelligence becomes operational through skill. Skill formation integrity therefore becomes a foundational condition of trustworthy human capability, AI capability, autonomous systems, robotics, and future intelligence ecosystems.
