

Surface Label Integrity Module (SLIM)

Category: Product & Design

Subcategory: Surface Integrity Implementation

Type: Integrity Enforcement Module

Parent Standard: Surface Integrity Standard (SIS)

Version: 1.0

Status: Canonical · Open Module

Effective Date: 10 April 2026

Compatibility:

SIS · INTEGROS® · CGRM · Consumer Protection Systems

Canonical Definition System

Surface Label Integrity defines the non-bypassable conditions under which labels, stickers, and surface markings may be applied without altering, damaging, or leaving any trace on a surface.

A label is valid only if it can be removed without:

- damage
 - residue
 - chemical intervention
 - structural or visual change
-

A. Module Abstract

The Surface Label Integrity Module establishes the conditions required to ensure that product identification does not compromise surface integrity.

The objective is to ensure that:

- labels remain temporary
- surfaces remain unchanged
- removal is clean and safe
- user experience is preserved

This module does not regulate label content.
It defines how labels interact with surfaces.

B. Core Principle

A label may identify a surface.

It must not alter it.

C. Structural Requirements

1. Non-Damage Condition

Labels MUST NOT:

- damage material
 - remove coating
 - alter surface structure
 - affect visual integrity
-

2. Full Removability Condition

Labels MUST:

- be removable without tools
 - require no force that risks damage
 - require no heat or solvents
 - leave the surface unchanged
-

3. Residue-Free Condition

After removal:

- no adhesive residue may remain
 - no contamination may occur
 - no discoloration may be present
-

4. Material Compatibility Condition

Labeling systems MUST:

- be compatible with the surface material
 - not chemically interact
 - not penetrate surface structure
-

5. Sensitive Surface Protection

High-risk materials include:

- untreated wood
- soft coatings
- natural finishes
- porous materials

For these:

direct labeling is prohibited unless full compliance is guaranteed.

6. Alternative Labeling Requirement

Where direct labeling is not safe, the system MUST use:

- hanging tags
 - string labels
 - removable sleeves
 - external packaging labels
-

D. Minimum Implementation Framework (MIF)

Step 1 — Identify Surface Type

The system **MUST** classify material type before applying labels.

Step 2 — Validate Label Compatibility

The system **MUST** ensure adhesive compatibility with the surface.

Step 3 — Test Removability

The system **MUST** verify:

- removal without tools
 - no damage
 - no residue
-

Step 4 — Apply Only if Safe

Labels **MUST** be applied only if all conditions are satisfied.

Step 5 — Provide Safe Alternative

If risk exists, direct labeling **MUST NOT** be used.

E. Validation Logic

A labeled surface is valid only if:

- label is removable
 - surface remains unchanged
 - no residue exists
 - no damage occurs
-

F. Prohibited Conditions

The system is non-compliant if:

- label damages surface
 - residue remains
 - removal requires chemicals
 - surface is altered
-

G. Consumer Protection Condition

If a label:

- cannot be removed safely
- leaves residue
- alters the surface

the product is classified as:

Integrity Compromised Surface

H. Operational Output

This module ensures:

- clean labeling
 - preserved surface integrity
 - improved user experience
 - real product quality
-

I. Integration Logic

This module operates with:

- **SIS** → defines surface rules
 - **INTEGROS®** → ensures traceability
 - **CGRM** → enforces responsibility
-

J. Case 1 — Surface Degradation After Label Removal

Scenario

A product surface is damaged during label removal.

Without Module

- residue remains
- surface altered
- damage accepted

With Module

- unsafe labeling blocked
- alternative used

Result

Surface remains intact.

K. Case 2 — Reuse Failure Due to Adhesive

Scenario

Reusable product cannot be reused due to label residue.

Without Module

- product discarded
- reuse fails

With Module

- clean removal ensured
 - reuse preserved
-

Result

Product lifecycle is extended.

Structural Principle

A label is temporary.

A surface is not.

Canonical Closing Statement

Surface Label Integrity Module establishes a non-bypassable condition:

identification must never degrade the surface it is applied to.
