

About the Urban Surface Integrity Module (USIM)

What This Module Defines

The **Urban Surface Integrity Module (USIM)** defines how surfaces in public and shared environments must be protected from unauthorized marking, use, and degradation.

It establishes a clear boundary:

- what is authorized use
- what is unauthorized intervention

This module ensures that surfaces remain:

- controlled
 - protected
 - accountable
-

Core Message

Expression is not the problem.

Unauthorized use of space is.

What This Module Solves

In current systems:

- surfaces are repeatedly marked
- damage is normalized
- responsibility is unclear
- public cost is continuous

Unauthorized markings act as:

- uncontrolled communication
- repeated identity exposure
- indirect promotion

The result:

- degraded infrastructure
 - increased maintenance costs
 - loss of control over public space
-

System Shift

USIM introduces a structural change:

Public and shared surfaces are not open communication channels.

They are:

- owned
 - governed
-

- protected

Any use requires authorization.

For Cities and Municipal Systems

Cities gain:

- reduced cleaning and restoration costs
- control over visual environment
- ability to classify and enforce violations
- reduction of repeated damage cycles

Instead of reacting to damage, cities operate:

- proactively
 - systematically
 - with enforceable rules
-

For Sports Clubs and Organizations

Repeated tagging and identity marking often promotes:

- club names
- group identity
- territorial presence

Without control:

- visibility is gained without consent
- cost is transferred to the public
- responsibility remains unclear

With USIM:

- unauthorized marking is classified as promotion
- responsibility may extend beyond individuals
- organizations are incentivized to prevent misuse

This creates:

- internal responsibility
 - behavioral change
 - protection of brand integrity
-

For Companies and Infrastructure Owners

Companies operating:

- transport systems
- logistics infrastructure
- public-facing assets

face:

- repeated damage
 - operational disruption
 - increased maintenance costs
-

USIM enables:

- classification of damage as system violation
 - traceability and accountability
 - reduction of repeated incidents
 - protection of asset value
-

Behavioral Outcome

With USIM:

- individuals understand boundaries
 - groups become responsible
 - organizations become proactive
 - systems shift from reaction to control
-

Why This Will Be Adopted

Because it solves:

- uncontrolled visual pollution
- repeated public cost
- lack of responsibility
- system inefficiency

It replaces:

- tolerance → with structure
 - reaction → with control
 - anonymity → with accountability
-

System Insight

Unauthorized marking is not neutral behavior.

It is:

- use of space without consent
 - visual occupation
 - indirect promotion
 - structural degradation
-

Economic Reality

Every unauthorized marking creates:

- cleaning costs
- restoration costs
- material degradation
- repeated operational expense

Without structural control, the system absorbs these costs indefinitely.

What This Enables

USIM creates:

- enforceable surface protection
 - reduced long-term costs
 - controlled public environments
 - clear responsibility mapping
-

Final Statement

A surface belongs to its owner or to the public — not to whoever writes on it.

If space is used without permission,
it is not expression.

It is unauthorized use, damage, and promotion combined.
