

Urban Surface Integrity Module (USIM)

Category: Governance & Enforcement
Subcategory: Surface Integrity — Public Space
Type: Integrity Enforcement Module

Parent Standard: Surface Integrity Standard (SIS)

Version: 1.0
Status: Canonical · Open Module
Effective Date: 10 April 2026

Compatibility:
SIS · INTEGROS® · CGRM · Public Infrastructure Systems

Canonical Definition System

Urban Surface Integrity defines the conditions under which surfaces in public or shared environments must remain free from unauthorized markings, alterations, or use as uncontrolled communication channels.

A surface is considered integrity-valid only if it remains:

- unmarked without authorization
- structurally intact
- visually unaltered
- free from unauthorized communication

Any unauthorized marking constitutes surface degradation and system misuse.

A. Module Abstract

The Urban Surface Integrity Module establishes the rules required to protect surfaces in public and shared environments from unauthorized use.

The objective is to ensure that:

- surfaces are not used as uncontrolled communication channels
- public and private assets remain intact
- unauthorized markings are prevented and classified correctly
- responsibility is attributable and enforceable

This module does not regulate art.
It defines the boundary between authorized use and unauthorized intervention.

B. Core Principle

A surface is not a communication channel unless explicitly authorized.

C. Structural Requirements

1. Authorization Condition

Any marking, application, or visual modification must be:

- explicitly authorized
- legally permitted
- attributable to a responsible entity

Unauthorized marking is invalid.

2. Non-Use Condition

Surfaces must not be used for:

- identity signaling
- promotion
- tagging
- messaging
- advertising

unless explicitly authorized.

3. Surface Protection Condition

Surfaces must remain:

- structurally intact
- visually clean
- free from degradation

Any unauthorized marking is classified as damage.

4. Reversibility Condition

Any authorized marking must:

- be removable
- not damage the surface
- preserve original state

Irreversible impact constitutes degradation.

5. Responsibility Attribution Condition

All markings must be:

- attributable
- traceable
- linked to a responsible entity

Anonymous marking is prohibited.

6. Public Asset Protection Condition

Surfaces financed or maintained by public resources must:

- maintain integrity
- not be altered without authorization

Unauthorized marking constitutes public asset degradation.

D. Minimum Implementation Framework (MIF)

Step 1 — Surface Classification

Identify whether the surface is:

- public
 - private
 - shared
-

Step 2 — Authorization Definition

Define who has authority to approve markings.

Step 3 — Monitoring Condition

Ensure that surfaces are observable and controlled.

Step 4 — Detection Mechanism

Enable identification of unauthorized markings.

Step 5 — Response Logic

Define removal, restoration, and responsibility enforcement.

E. Validation Logic

A surface is valid only if:

- no unauthorized marking exists
 - no degradation is present
 - no uncontrolled communication occurs
-

F. Prohibited Conditions

The system is non-compliant if:

- surfaces are used without authorization
 - markings cannot be removed without damage
 - responsibility cannot be assigned
 - repeated unauthorized marking occurs
-

G. Enforcement Classification

Unauthorized marking is classified as:

- surface degradation
 - unauthorized use of space
 - unauthorized communication
-

H. Operational Output

This module ensures:

- protected public space
 - reduced repeated damage
 - enforceable responsibility
 - controlled communication boundaries
-

I. Integration Logic

This module operates with:

- SIS — defines surface rules
 - INTEGROS® — ensures traceability
 - CGRM — ensures governance and enforcement
-

J. Case 1 — Repeated Tagging of Public Infrastructure

Scenario

A surface is repeatedly marked with identifiable tags.

Without Module

- damage repeats
- no accountability
- cost accumulates

With Module

- marking classified as violation
- responsibility traceable
- enforcement possible

Result

Repeated degradation is reduced.

K. Case 2 — Unauthorized Use of Surface for Promotion

Scenario

A surface is used to display names, symbols, or group identity.

Without Module

- space becomes uncontrolled communication channel
- visibility benefits unknown entities

With Module

- classified as unauthorized communication
- responsibility extends to identifiable beneficiaries

Result

Surface use becomes controlled and accountable.

Structural Principle

A surface is not a communication channel unless explicitly authorized.

Canonical Closing Statement

Public space is not an uncontrolled communication surface.

Urban Surface Integrity Module establishes a non-negotiable condition:

Unauthorized markings are not expression.

They are surface degradation and unauthorized use of shared space.

If communication requires consent,
then unauthorized marking is not communication — it is violation.
