

# Surface Integrity Standard (SIS)

**OOF™ Origin Open Foundation™**

Independent Methodological Authority

**OriginID:** OOF-OID-GOV-SIS-2026-04-10-0001

**Category:** Governance & Enforcement

**Subcategory:** Surface Integrity

**Type:** Infrastructure-Level Integrity Standard

**Version:** 1.0

**Status:** Canonical · Open Standard

**Effective Date:** 10 April 2026

**Compatibility:**

INTEGROS®

CGRM

RTI

Product Systems

Urban Systems

**Authority:** OOF™ Origin Open Foundation™

**Protection:** MIP™ — Methodological Intellectual Property

**Canonical Language:** English (UCL™)

---

## Canonical Definition System

Surface Integrity defines the **non-bypassable conditions under which any physical surface remains intact, unaltered, and free from unauthorized modification.**

A surface is considered integrity-valid only if its:

- structure
- appearance
- material state

remain unaffected by unauthorized intervention.

Any modification without authorization constitutes integrity violation.

---

## A. Standard Abstract

Surface Integrity Standard (SIS) establishes the foundational rules governing how surfaces may be used, modified, or interacted with across systems.

The objective is to ensure that:

- surfaces are not altered without authorization

- surfaces do not become uncontrolled communication channels
- material integrity is preserved
- visual and structural state remains intact

This standard does not define specific environments.  
It defines the universal condition of surface integrity.

---

## B. Core Principle

**A surface must not be altered without authorization.**

---

## C. Core Integrity Conditions

All conditions **MUST** be present simultaneously.

---

### 1. Authorization Condition

Any modification, marking, or application to a surface **MUST**:

- be explicitly authorized
- be attributable to a responsible entity
- comply with defined conditions

Unauthorized interaction is invalid.

---

### 2. Non-Alteration Condition

A surface **MUST NOT** be:

- permanently altered
- structurally damaged
- visually degraded

without authorization.

---

### 3. Reversibility Condition

Any authorized modification **MUST**:

- be fully removable
- leave no residue
- preserve original surface state

Irreversible modification is considered degradation.

---

### 4. Material Protection Condition

Surface material **MUST** remain:

- intact
- undamaged
- structurally stable

Any penetration, chemical impact, or physical alteration is classified as damage.

---

### 5. Communication Control Condition

A surface **MUST NOT** function as a communication channel unless explicitly authorized. This includes:

---

- promotion
- identity signaling
- messaging
- advertising

Unauthorized communication constitutes misuse.

---

## 6. Responsibility Attribution Condition

Every surface modification MUST be:

- attributable
- linked to a responsible entity
- legally and operationally accountable

Anonymous modification is prohibited.

---

## D. Prohibited Conditions

A system is non-compliant if:

- surfaces are modified without authorization
- markings cannot be removed without damage
- residue or permanent alteration exists
- surfaces are used for unauthorized communication
- responsibility cannot be assigned

Any unauthorized alteration invalidates surface integrity.

---

## E. Threshold Logic

Surface condition is:

- **VALID** → no unauthorized modification, no damage, no residue
- **INVALID** → any unauthorized modification, damage, or alteration

No partial compliance is permitted.

---

## F. Scope

Applicable to:

- product surfaces
  - urban infrastructure
  - buildings and structures
  - transport systems
  - shared public assets
  - private surfaces exposed to interaction
- 

## G. System Position

SIS functions as the **root integrity layer for all surface-related systems.**

---

All domain-specific applications operate as modules under this standard, including:

- Product Surface Integrity (PSI)
- Urban Surface Integrity (USI)

---

## H. Structural Principle

A surface is not a medium.

It becomes one only through explicit authorization.

---

## I. Compatibility Statement

A system may declare:

### "Surface Integrity Compliant"

only if all conditions are continuously satisfied.

---

## Canonical Closing Statement

A surface may be used.

**It must not be altered without permission.**

Surface Integrity Standard establishes a non-negotiable condition:

**unauthorized modification is degradation, not use.**
