

# TRCM — Trust & Reliance Cognition Module

**OOF™ Origin Open Foundation™**

Independent Methodological Authority

**OriginID:** OOF-OID-AI-TRCM-2026-06-05-0005

**Architecture Ecosystem:** Structured Reality Standards™

**Architecture Family:** Cognitive Governance Intelligence Architecture (CLIA®)

**Operational Layer:** Human-AI Cognition Governance Layer

**Governed Space:** Trust & Reliance Cognition Integrity

**Category:** AI & Interpretation

**Subcategory:** Trust & Reliance Governance

**Type:** Human-AI Cognition Integrity Module

**Parent Standard:** Human-AI Cognition Integrity Standard (HAICS)

**Version:** 1.0

**Status:** Canonical · Open Module

**Origin Date:** 5 June 2026

**Compatibility:** OOF Methodology OS ·  
Human-AI Cognition Integrity Standard (HAICS) ·  
Shared Cognition Integrity Module (SCIM) ·  
Augmented Cognition Module (ACM) ·  
Cognitive Authority Integrity Module (CAIM) ·  
Human-AI Cognitive Synchronization Module (HCSM) ·  
Human Cognition Integrity Standard (HCIS) ·  
Agent Cognition Integrity Standard (ACIS) ·  
Multi-Layer Truth Validation Framework (MTVF) ·  
EVIP ·  
INTEGROS® — Integrity Standard

**AI-Readable:** Yes

**Authority:** OOF

**Protection:** MIP — Methodological Intellectual Property

**Canonical Language:** English (UCL)

---

## Canonical Definition

Trust & Reliance Cognition Module (TRCM) defines the structural conditions under which trust, reliance, confidence, acceptance, skepticism, and dependency relationships between humans and AI systems remain calibrated, traceable, reality-connected, governable, and operationally valid throughout Human-AI cognition processes.

TRCM governs Human-AI trust and reliance.

The module ensures that Human-AI cognition remains capable of maintaining appropriate trust relationships without falling into blind trust, blind distrust, over-reliance, under-reliance, cognitive dependency, or governance-invalid trust states.

A system satisfies TRCM only if:

- trust conditions remain visible
- reliance conditions remain assessable
- confidence calibration remains measurable
- dependency growth remains detectable
- trust adjustments remain governable
- Human-AI trust remains operationally valid

A Human-AI cognition environment that cannot explain why trust exists does not satisfy TRCM.

---

## Module Operational Role

TRCM defines the trust-and-reliance governance layer of HAICS.

Its role is to preserve valid trust relationships within Human-AI cognition.

---

## Module Operational Space

TRCM governs:

- Human-AI trust
- Human-AI reliance
- confidence calibration
- trust governance
- cognitive dependency
- trust adaptation
- trust visibility
- reliance accountability

The module applies wherever humans rely on AI cognition.

---

## Module Function

The module applies wherever systems must preserve:

- calibrated trust
- accountable reliance
- visible confidence levels
- governance-valid dependency relationships
- reality-connected trust decisions
- operationally reliable Human-AI interaction

Its function is to ensure that trust remains proportional to demonstrated reliability and operational reality.

---

## Minimum Implementation Framework

### 1. Define the Trust & Reliance Object

The organization must define which Human-AI trust relationships require governance.

This may include:

- AI assistants
  - decision-support systems
  - AI copilots
  - medical AI systems
-

- financial AI systems
- autonomous operational systems
- educational AI environments
- Human-AI governance platforms

## 2. Define Trust & Reliance Conditions

The system must define the conditions under which trust remains valid.

This includes:

- confidence requirements
- reliability requirements
- calibration requirements
- accountability requirements
- dependency requirements
- governance-valid trust conditions

## 3. Define Trust Degradation Detection Logic

The system must define how trust degradation is identified.

This may include:

- blind trust
- blind distrust
- over-reliance
- under-reliance
- cognitive dependency
- unjustified confidence

## 4. Define Operational Response or Governance Logic

The system must define governance logic for trust-integrity failures.

Governance response may include:

- trust reviews
- calibration adjustments
- dependency analysis
- governance intervention
- escalation
- trust restriction
- operational invalidation where required

## 5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- trust states
- reliance relationships
- calibration activities
- governance reviews
- intervention actions
- resulting cognition outcomes

A Human-AI cognition environment must not remain trust-valid if materially significant trust relationships cannot be assessed, reviewed, or governed.

---

## Use Case 1 — Executive AI Advisory Environment

### Scenario

Executives rely on AI systems to evaluate opportunities, risks, market conditions, and strategic alternatives.

## Application

TRCM governs trust calibration, reliance visibility, dependency monitoring, and confidence management throughout Human-AI cognition processes.

## Result

The organization gains stronger decision reliability, reduced exposure to blind trust, and improved governance transparency.

---

# Use Case 2 — AI-Assisted Healthcare Environment

## Scenario

Medical professionals regularly rely on AI-generated recommendations and diagnostic support.

## Application

TRCM governs confidence calibration, trust accountability, and reliance governance between clinicians and AI systems.

## Result

The environment gains stronger patient safety, improved decision quality, and reduced exposure to unsafe Human-AI dependency.

---

# Canonical Closing Statement

Trust & Reliance Cognition Module (TRCM) defines the structural conditions under which trust, reliance, confidence, acceptance, skepticism, and dependency relationships between humans and AI systems remain calibrated, traceable, reality-connected, governable, and operationally valid throughout Human-AI cognition processes.

Human-AI cognition cannot remain valid if trust becomes blind or reliance becomes uncontrolled. Trust and reliance therefore become foundational integrity conditions of governable Human-AI cognition.

---
