

MTVF® Module

TSA — Truth Status of Assets

OriginID: OOF-OID-AI-INT-MTVF-TSA-2026-04-04-0001
Category: AI and Interpretation
Subcategory: Asset Integrity
Module: Truth Status of Assets (TSA)
Type: Integrity Output Module

System: MTVF — Multi-Layer Truth Validation Framework

Version: 1.0
Status: Canonical Module
Effective Date: 4 April 2026

Compatibility: MTVF · TVL · ArtData · AI Governance Systems · Blockchain Systems

Authority: OOF™ Origin Open Foundation™
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL™)

A. Module Abstract

The **Truth Status of Assets (TSA)** module defines the final integrity classification of an asset after multi-layer validation.

The objective is to determine whether an asset:

- can be trusted
- can be used
- must be restricted or rejected

TSA does not validate data.
It defines the **decision state after validation**.

B. Canonical Definition

Truth Status of Assets (TSA) is the final classification layer within the MTVF system that determines whether an asset is:

- structurally valid
- verifiable
- safe for interaction

TSA operates independently of legal, regulatory, or declared classification.

C. Structural Base

This module is based on:

- Multi-Layer Validation Output
- Cross-Layer Integrity Results
- Non-Assumption Rule
- Decision-State Logic

Trust must be derived from validation, not declaration.

D. Classification States

TSA defines three mutually exclusive states:

1. Verified Integrity

- data is traceable and auditable
- structure is consistent
- no manipulation detected

→ asset is **approved for interaction**

2. Unverified

- incomplete validation
- insufficient traceability
- integrity cannot be confirmed

→ asset is **restricted or conditional**

3. Contaminated

- manipulation detected
- structural inconsistency
- integrity breach present

→ asset is **blocked and rejected**

E. Structural Rule (Critical)

No system interaction is permitted without TSA classification.

F. Decision Logic

TSA output directly defines system behavior:

- **Verified** → allowed
 - **Unverified** → restricted
-

- **Contaminated** → blocked

No override is permitted without revalidation.

G. Methodology

1. Receive validated asset data from MTVF layers
 2. Evaluate structural consistency
 3. detect contamination or anomalies
 4. assign TSA classification
 5. enforce decision state
-

H. System Role

TSA functions as:

Final Trust Gate

It determines whether an asset can enter:

- AI systems
 - financial systems
 - decision systems
 - interaction layers
-

I. System Independence

This module applies across:

- digital assets
- datasets
- tokens
- AI inputs
- cross-chain systems

Integrity logic remains constant regardless of environment.

J. Threshold Logic

Asset state is:

- **VERIFIED** → usable
- **UNVERIFIED** → restricted
- **CONTAMINATED** → non-usable

No partial trust is permitted.

K. Structural Principle

Existence does not imply trust.

Trust must be validated and classified.

Canonical Closing Statement

Modern systems operate on assumed trust.
TSA replaces assumption with classification.

Truth Status of Assets Module establishes a non-negotiable condition:
no asset may be used without verified integrity status.
