

UHM — User History Integrity Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-MEM-UHM-2026-06-08-0004

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Memory Governance Intelligence Architecture (MGIA™)

Operational Layer: User Memory Governance Layer

Governed Space: User History Integrity

Category: AI & Interpretation

Subcategory: Historical Memory Governance

Type: User Memory Integrity Module

Parent Standard: User Memory Integrity Standard (UMIS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 8 June 2026

Compatibility: OOF Methodology OS · User Memory Integrity Standard (UMIS) ·

Memory Integrity Standard (MIS) · User Context Memory Module (UCMM) ·

User Intent Memory Module (UIMM) · Temporal Memory Integrity Standard (TMIS) ·

Human-AI Cognition Integrity Standard (HAICS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

User History Integrity Module (UHM) defines the structural conditions under which memory related to a user's historical interactions, activities, decisions, preferences, context, and experiences remains traceable, reconstructable, coherent, accountable, and operationally valid throughout the user-memory lifecycle.

UHM governs user history integrity.

The module ensures that historical memory remains sufficiently accurate and reconstructable to support continuity, personalization, accountability, and long-term Human-AI relationships.

A system satisfies UHM only if:

- user history remains reconstructable
- historical continuity remains preservable
- historical events remain traceable
- history degradation remains detectable
- historical memory remains accountable
- user history remains operationally valid

A system that cannot reliably reconstruct meaningful user history does not satisfy UHIM.

Module Operational Role

UHIM defines the historical-memory governance layer of UMIS.

Its role is to preserve integrity of user history across time.

Module Operational Space

AMAM governs:

- user history memory
- historical continuity
- interaction history
- historical reconstruction
- historical traceability
- experience preservation
- history accountability
- history governance

The module applies wherever systems maintain memory of past user interactions and experiences.

Module Function

The module applies wherever systems must preserve:

- interaction continuity
- historical context
- reconstructable user history
- governance-valid historical memory
- long-term personalization continuity
- trustworthy Human-AI relationships

Its function is to ensure that user history remains available, coherent, and operationally useful across time.

Minimum Implementation Framework

1. Define the User History Object

The organization must define which historical memory elements require governance.

This may include:

- interaction history
 - activity history
 - decision history
-

- preference history
- project history
- relationship history
- learning history
- Human-AI interaction history

2. Define User History Conditions

The system must define the conditions under which user history remains valid.

This includes:

- continuity requirements
- traceability requirements
- reconstruction requirements
- preservation requirements
- accountability requirements
- governance-valid history conditions

3. Define History Degradation Detection Logic

The system must define how historical degradation is identified.

This may include:

- history loss
- fragmented historical records
- reconstruction failures
- historical inconsistency
- context-detached history
- history drift

4. Define Operational Response or Governance Logic

The system must define governance logic for history-integrity failures.

Governance response may include:

- history review
- reconstruction activities
- continuity restoration
- governance intervention
- escalation
- historical validation
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- historical events
- history updates

- validation activities
- governance reviews
- intervention actions
- resulting historical states

A user-memory environment must not remain history-valid if materially significant historical information cannot be reconstructed, reviewed, or governed.

Use Case 1 — Long-Term Personal AI Companion

Scenario

An AI companion continuously interacts with a user over many years while preserving interaction history, experiences, and relationship continuity.

Application

UHIM governs historical continuity, interaction traceability, and long-term preservation of relationship memory.

Result

The AI maintains stronger continuity, improved contextual understanding, and reduced exposure to historical memory loss.

Use Case 2 — Enterprise Customer Relationship Environment

Scenario

A company maintains long-term memory of customer interactions, service history, preferences, and operational relationships.

Application

UHIM governs historical reconstruction, continuity preservation, and accountability of customer-related memory.

Result

The organization gains stronger customer continuity, improved service quality, and reduced exposure to fragmented historical records.

Canonical Closing Statement

User History Integrity Module (UHIM) defines the structural conditions under which memory related to a user's historical interactions, activities, decisions, preferences, context, and experiences remains traceable, reconstructable, coherent, accountable, and operationally valid throughout the user-memory lifecycle.

Long-term Human-AI continuity cannot exist without trustworthy historical memory. User history integrity therefore becomes a foundational integrity condition of durable Human-AI relationships and reliable personalization.
