

UMAM — User Memory Accountability Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-MEM-UMAM-2026-06-08-0005

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Memory Governance Intelligence Architecture (MGIA™)

Operational Layer: User Memory Governance Layer

Governed Space: User Memory Accountability Integrity

Category: AI & Interpretation

Subcategory: User Memory Accountability Governance

Type: User Memory Integrity Module

Parent Standard: User Memory Integrity Standard (UMIS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 8 June 2026

Compatibility: OOF Methodology OS · User Memory Integrity Standard (UMIS) ·

Memory Integrity Standard (MIS) · Memory Accountability Integrity Module (MAIM) ·

Human-AI Cognition Integrity Standard (HAICS) · Memory Governance Standard (MGS) ·

INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

User Memory Accountability Module (UMAM) defines the structural conditions under which creation, storage, modification, retrieval, utilization, sharing, preservation, and governance of user-related memory remain attributable, traceable, reviewable, governable, and operationally accountable throughout the user-memory lifecycle.

UMAM governs user memory accountability.

The module ensures that memory associated with a user remains linked to identifiable actions, responsibilities, governance controls, and accountable operational processes.

A system satisfies UMAM only if:

- memory actions remain attributable
- accountability relationships remain visible
- governance oversight remains assessable
- responsibility remains identifiable
- memory utilization remains reviewable
- accountability remains operationally valid

A user-memory environment that cannot explain who created, modified, utilized, or governed user memory does not satisfy UMAM.

Module Operational Role

UMAM defines the accountability-governance layer of UMIS.

Its role is to preserve accountability throughout the user-memory lifecycle.

Module Operational Space

AMAM governs:

- user memory accountability
- memory ownership
- responsibility attribution
- memory governance
- memory oversight
- memory-action traceability
- accountability preservation
- user-memory governance

The module applies wherever systems maintain memory associated with users.

Module Function

The module applies wherever systems must preserve:

- accountable memory usage
- visible responsibility chains
- governance-valid personalization
- traceable memory operations
- trustworthy Human-AI relationships
- operational transparency

Its function is to ensure that user memory remains linked to accountable operational behavior.

Minimum Implementation Framework

1. Define the User Memory Accountability Object

The organization must define which user-memory activities require accountability governance.

This may include:

- preference updates
 - context updates
-

- intent updates
- history modifications
- personalization activities
- memory sharing
- memory deletion
- Human-AI memory interactions

2. Define User Memory Accountability Conditions

The system must define the conditions under which accountability remains valid.
This includes:

- attribution requirements
- responsibility requirements
- oversight requirements
- governance requirements
- reviewability requirements
- accountability-valid conditions

3. Define Accountability Degradation Detection Logic

The system must define how accountability degradation is identified.
This may include:

- anonymous memory actions
- ownership ambiguity
- governance-blind modification
- oversight failures
- unattributed personalization
- accountability gaps

4. Define Operational Response or Governance Logic

The system must define governance logic for accountability-integrity failures.
Governance response may include:

- accountability review
- attribution verification
- governance intervention
- escalation
- operational restrictions
- corrective actions
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- memory actions

- accountability assignments
- governance reviews
- intervention activities
- oversight procedures
- resulting memory states

A user-memory environment must not remain accountability-valid if materially significant memory activities cannot be attributed, reconstructed, reviewed, or governed.

Use Case 1 — Personal AI Assistant

Scenario

A personal AI assistant continuously maintains user preferences, context, goals, and interaction history across long-term Human-AI relationships.

Application

UMAM governs accountability of memory updates, personalization activities, and user-memory utilization.

Result

The user gains stronger trust, improved transparency, and greater confidence in how memory is managed.

Use Case 2 — Enterprise Human-AI Platform

Scenario

A large enterprise platform maintains memory associated with employees, customers, partners, and operational users.

Application

UMAM governs responsibility attribution, governance oversight, and accountability of user-memory operations.

Result

The organization gains stronger governance reliability, improved auditability, and reduced exposure to accountability failures.

Canonical Closing Statement

User Memory Accountability Module (UMAM) defines the structural conditions under which creation, storage, modification, retrieval, utilization, sharing, preservation, and governance of user-related memory remain attributable, traceable, reviewable, governable, and operationally accountable throughout the user-memory lifecycle.

User memory cannot remain trustworthy if nobody is accountable for how it is created, modified, or utilized.

User memory accountability therefore becomes a foundational integrity condition

of trustworthy Human-AI memory systems.
