

Virtual Representation Module (VRM™)

OOF™ Origin Open Foundation™

Independent Methodological Authority

Category: AI and Interpretation

Subcategory: Representation and Copy

Module: Virtual Representation Module (VRM™)

Type: Representation Module

Standard: Representation & Copy Standard (RCS™)

Status: Canonical Module

Version: 1.0

Effective Date: 19 March 2026

Canonical Definition

A Virtual Representation is a non-physical presentation of an asset in a digital or simulated environment that allows access, viewing, or interaction without transferring or altering the original asset.

A virtual representation does not replace the original and does not constitute ownership of the asset.

Why This Matters

Without clear classification of virtual representations:

- digital experiences may be confused with ownership
- representations may be mistaken for copies
- original assets may be exposed to unnecessary risk
- access and control become unclear

Virtual representation separates access from possession.

Minimum Implementation Framework (MIF)

Step 1 — Identify Source Asset

Define the original asset or source from which the representation is created.

Step 2 — Confirm Non-Physical Form

Ensure the representation exists only in digital or simulated space.

Step 3 — Define Representation Purpose

Establish that the asset is presented for viewing, interaction, or experience — not transfer.

Step 4 — Declare Representation Status

The asset must be clearly identified as a virtual representation.

Step 5 — Preserve Origin Link

The representation must maintain a clear relationship to the original asset.

Use Case 1 — Virtual Museum Exhibition

Scenario

A museum creates a virtual gallery accessible worldwide.

Application

Artworks are presented as virtual representations without moving physical originals.

Result

- global access to cultural heritage
 - protection of original works
 - reduced cost and logistics
-

Use Case 2 — Digital Experience Platforms

Scenario

A platform offers immersive viewing of artworks or objects in a virtual environment.

Application

Assets are classified as virtual representations.

Result

- scalable access
 - independent exhibition models
 - no need for physical transfer
-

Structural Principle

Access does not require transfer.
Representation does not imply ownership.

Closing Statement

The original stays in place.
The experience travels.
