

Value Activation Standard (VAS)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-ECO-VAS-2026-03-07-0001

Category: Economic & Value Standards

Subcategory: Value Activation & Flow Governance

Version: 2.0

Status: Canonical · Open Standard

Effective Date: 7 March 2026

Compatibility:

- Value Flow Mechanism (VFM)
- ZVA (Zero Value Asset) Standard
- Origin Asset Standard

Authority: OOF™ Origin Open Foundation™

Protection: Methodological Intellectual Property

Canonical Language: English

Canonical Definition System

Value Activation Standard defines the **non-bypassable conditions** under which an asset becomes economically active within a governed system.

Assets do not automatically participate in value flows.

An asset must pass structural validation before entering an active value state.

Economic participation is conditional on verification, not existence.

A. Standard Abstract

VAS establishes an integrity-first economic model where value activation precedes value distribution.

The objective is to ensure that:

- value does not flow before validation
- assets are structurally verified before participation
- economic entry points are controlled
- value flows remain governed and traceable

This standard does not define value.
It defines when value becomes active.

B. Core Principle

Value must not flow before integrity is verified.

Assets that cannot demonstrate origin integrity, structural compatibility, or governance compliance remain economically inactive.

C. Operational Model

VAS defines a four-stage activation architecture.

Stage 1 — Inactive Asset State

All assets entering a system are initially:

economically inactive

In this state:

- no yield may be generated
- no liquidity participation occurs
- no economic distribution is permitted

Assets may exist, but they are not economically active.

Stage 2 — Structural Validation

The system verifies:

- asset origin integrity
- system compatibility
- governance compliance
- responsibility anchoring

Assets failing validation remain inactive.

Stage 3 — Value Activation

Assets that pass validation enter an: **Active Value State**

Activated assets may:

- participate in value flows
- generate yield
- serve as collateral
- enter liquidity systems

Activation represents admission into the governed economy.

Stage 4 — Value Flow Distribution

Once activated:

- value may flow through predefined mechanisms
 - distribution remains governed
 - all flows remain traceable
-

D. Prohibited Condition

No asset may participate in value generation, distribution, or liquidity mechanisms before successful structural validation.

Any value flow without prior activation is considered invalid within the governed system.

E. Purpose & Scope

VAS establishes a structural model where economic participation is conditional. It enables systems to maintain:

- controlled liquidity entry
- traceable capital flow
- governance-based activation
- integrity-based economic participation

Applicable to:

- blockchain systems
 - financial infrastructure
 - tokenized assets
 - AI data economies
 - digital markets
-

F. Structural Principle

Value activation must precede value flow.

Canonical Closing Statement

Economic value must be activated through integrity validation before it is allowed to flow.
