

ZVA™ (Zero Value Asset) Standard

OOF™ Origin Open Foundation™

Global Methodology Authority

OriginID: OOF-OID-ECO-ZVA-2026-01-20-0001

Category: Economic & Value Standards (ECO)

Subcategory: Zero Value Asset (ZVA)

Version: 1.0

Status: Canonical · Binding

Effective Date: 26 January 2026

Compatibility:

Methodology OS™: Compatible

Authority: OOF™ Origin Open Foundation™

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL™)

B. Standard Abstract

This standard defines ZVA™ (Zero Value Asset) as a formally recognized asset state in which an asset exists but carries zero admissible economic value.

It establishes the structural, ethical, ecological, legal, and authenticity conditions under which value nullification occurs.

The standard defines Zero Value as a stable and governed state within a deterministic asset lifecycle.

C. Canonical Definition

A ZVA™ (Zero Value Asset) is defined as an asset that formally exists, retains identity and history, but is assigned zero admissible economic value within a governed system.

ZVA™ represents a state, not a number, loss, debt, negative valuation, or accounting write-off.

D. Base

This standard is based on:

- The Canonical Definition System™
- Asset State Determinism
- Traceable Identity and Origin Integrity
- Non-Skippable State Transitions
- Value as a governed condition rather than a subjective assignment

E. Purpose & Scope

Purpose

To establish a deterministic global classification for assets that must be excluded from economic participation due to failure of authenticity, legality, ethical compliance, ecological integrity, or systemic safety.

Scope

This standard applies to:

- Physical assets
- Digital assets
- Virtual assets
- Hybrid systems
- AI-generated outputs
- Economic instruments

This standard does not define pricing models, valuation methods, or market mechanisms.

F. Applicability

This standard applies when an asset:

- cannot establish verified identity
- fails authenticity validation
- violates ecological or ethical conditions
- breaches legal or regulatory compliance
- poses systemic economic risk
- cannot be safely licensed or responsibly integrated

Applicability is determined through governed evaluation layers.

G. Protocol

ZVA™ classification follows multi-layer evaluation:

1. Identity & Verification Layer

Failure of origin traceability or authenticity verification results in ZVA™ assignment.

2. Ecological & Ethical Evaluation Layer

Assets causing ecological harm or ethical violations qualify for ZVA™ status.

3. Authenticity & Integrity Layer

Assets containing falsified, manipulated, contradictory, or unverifiable data

qualify for ZVA™ status.

4. Legality & Compliance Layer

Assets illegal to produce, trade, or operate qualify for ZVA™ status.

5. Economic Function Layer

Assets that cannot be validated, licensed, safely used, or integrated into the real economy may be classified as ZVA™.

All classifications must be recorded and remain traceable.

H. Classification & States

Canonical Asset State Sequence

1. Origin Asset™
2. DeMonet™
3. ZVA™
4. ReMonet™
5. Value Asset™

ZVA™ is a stable asset state within this sequence.

Transition Rule

ZVA™ cannot transition directly to Value Asset™.

ReMonet™ is the only permitted transition mechanism.

Skipping states, rewriting history, or direct value injection constitutes systemic manipulation within governed systems.

I. Licensing & Usage

Reference use of this standard is permitted without license.

Implementation of ZVA™ classification mechanisms in operational or commercial systems requires an OOF™ license.

Derivative frameworks replicating the governed zero-value asset state logic require explicit authorization under MIP™ protection.

J. Compatibility & Dependencies

This standard is compatible with:

- Methodology OS™
-

- DeMonet™ Standard
- ReMonet™ Standard
- Canonical Meaning Framework
- MTVF™ (Truth Layer)
- CAP™ (Chain of Authenticity Protocol)

ZVA™ operates as a foundational classification within the Economic & Value Standards domain.

K. Non-Compliance Consequences

Assets processed in contradiction to this standard:

- are classified as non-admissible
- cannot enter value-based systems
- cannot participate in governed economic processes

Improper value assignment without ReMonet™ transition is invalid within canonical systems.

Canonical Closing Statement

ZVA™ is not failure.

It is a controlled suspension of economic value within a governed lifecycle.
